18	DME/Ethanol (1:4)	KO ^t Bu	4	64
19	THF/Ethanol (1:4)	KO ^t Bu	4	20
20	DMSO	KO ^t Bu	4	54
21	DMF	KO ^t Bu	4	62
22	CH ₃ CN	KO ^t Bu	4	60

Reaction conditions: **1** (0.5 mmol), **2** (0.62 mmol), CuI (0.025 mmol= 5 mol%), base (1 mmol), solvent (250 µL), 100 °C, N₂ atm.

2. Kinetic study

Table S2: Yield of **3a** (%) in 20% H₂O/DME and ethanol

Entry	Time (hrs)	Yield (%)	
		(3a)	(3a)
		(20% H ₂ O/DME)	(Ethanol)
1	1	17	65
2	2	47	73
3	3	72	76
4	4	77	77
5	5	78	78
6	6	78	78

Reaction conditions: **1** (0.5 mmol), **2** (0.62 mmol), CuI (0.025 mmol= 5 mol%), base (1 mmol), solvent (250 µL), 100 °C, N₂ atm.

3. Determination of Reaction Order in iodobenzene: Coupling of 4-methylbenzenethiol with iodobenzene using different concentrations.

Table S3. Yield of **4a** (%) with variation in concentration of iodobenzene (**2**).

4-methylthiophenol (mmol)	2 (mmol)	[2] / M	Yield 4a (%) ^a	Rate (mM/min)
0.5	0.375	1.5	42	6.95
0.5	0.5	2	48	7.95
0.5	0.62	2.48	54	9.00
0.5	0.75	3	56	9.22

^a Yield (%) is calculated with respect to the 4-methylthiophenol.

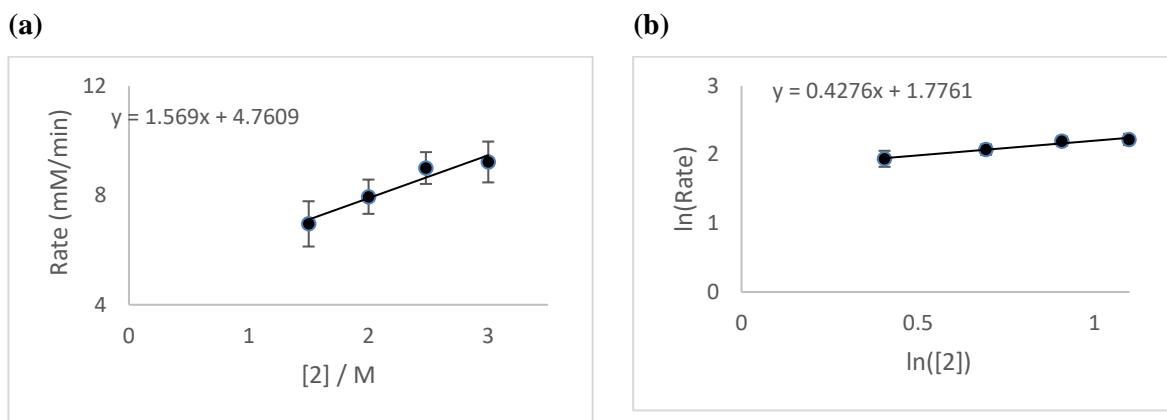

Figure S1: The plot of (a) Rate (M/s) vs concentration of iodobenzene [2], (b) $\ln(\text{Rate})$ vs $\ln[2]$.

4. Determination of Reaction Order in 4-methylbenzenethiol: Coupling of different concentrations of 4-methylbenzenethiol with iodobenzene.

Table S4. Yield of **4a** (%) with variation in concentration of 4-methylbenzenethiol.

4-methylthiophenol (mmol)	2 (mmol)	[4-methylbenzenethiol] / M	Yield ^a 4a (%)	Rate (mM/min)
0.5	0.62	2	54	8.94
0.62	0.62	2.48	48	9.93
0.75	0.62	3	44	11.32

^a Yield (%) is calculated with respect to the 4-methylthiophenol.

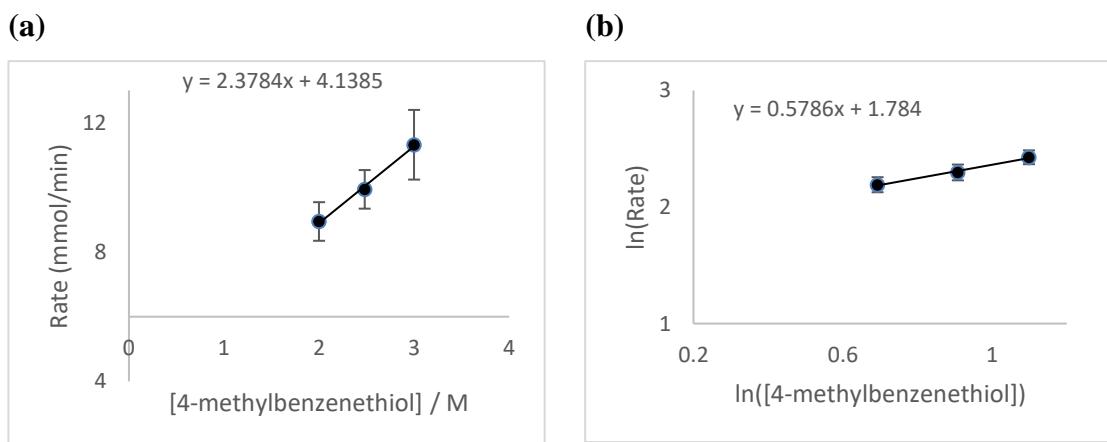

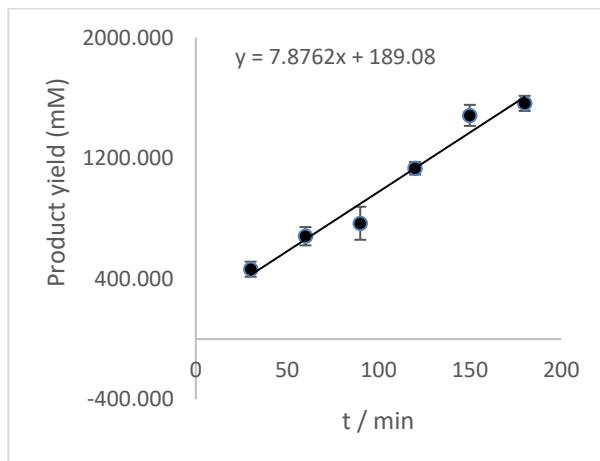

Figure S2: The plot of (a) Rate (M/s) vs concentration of 4-methylbenzenethiol, (b) $\ln(\text{Rate})$ vs $\ln[4\text{-methylbenzenethiol}]$.

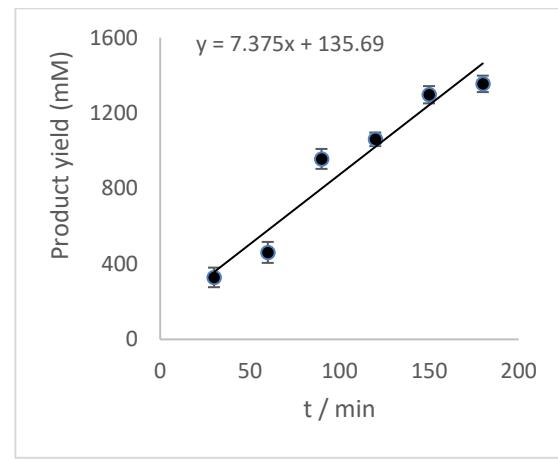

5. Kinetics Analysis Set-I: Initial rates for C-S coupling reaction between 4-methylbenzenethiol with substituted aryl iodides.

Reactions of 4-methylbenzenethiol with substituted aryl iodides were carried out in ethanol under standard reaction conditions. In each set of experiments, reactions were terminated at the interval of 30 min. for three hours duration and product yields were determined. It was difficult to determine the concentration of thiols because of salt formation in basic medium. Similarly, significant variations in concentration of aryl iodides were observed in these coupling reactions. Hence, initial rates were determined using product concentrations at stipulated time interval. Each reaction was repeated thrice to get reliable value of product concentration. Initial rates (mM/min) were determined using plot of product yield (mM) versus time (min). Simple linear regression graphs were obtained in Microsoft Excel. Hammett plot was generated by plotting logarithms of initial rates of coupling constant versus substituents constant. Initial rate of coupling reactions has often used in Hammett analysis.¹

6. Kinetics data for the Hammett plot with the variation of Aryl iodides

Table S4. Hammett parameter, initial rate, and relevant calculated data for C-S coupling reaction between 4-methylbenzenethiol with substituted aryl iodides.

Substrate	Hammett	Initial rate	r_x/r_H	$\log(r_x/r_H)$
	Parameter, σ_p	(mM/min)		
Iodobenzene	0	7.87	1	0
4-idoanisole	-0.37	7.37	0.936365252	-0.02855
4-iodotoluene	-0.17	7.56	0.960234631	-0.01762
1-chloro-4-iodobenzene	0.23	8.85	1.124780986	0.051068
1-bromo-4-iodobenzene	0.25	10.61	1.347731139	0.129603

7. Kinetics Analysis Set-II: Initial rates for C-S coupling reaction between substituted thiophenols with iodobenzene.

Reactions of substituted thiophenols with iodobenzene were carried out in ethanol under standard reaction conditions. In each set of experiments, reactions were terminated at the interval of 30 min. for three hours duration and product yields were determined. It was difficult to determine the concentration of thiols because of salt formation in basic medium. Similarly, significant variations in concentration of iodobenzene were observed in these coupling reactions. Hence, initial rates were determined using product concentrations at stipulated time interval. Each reaction was repeated thrice to get reliable value of product concentration. Initial rates (mM/min) were determined using plot of product yield (mM) versus time (min). Simple linear regression graphs were obtained in Microsoft Excel. Because of unavailability of unsubstituted benzenethiol, we could not determine kinetics data for reactions involving unsubstituted benzenethiol. Initial rate for the reaction of unsubstituted benzenethiol with iodobenzene was determined from plot of initial rates of derivatives of thiophenols versus substituent constant (Figure S5). From this graph, initial rate value corresponds to substituent constant value ($\sigma = 0$) is considered as initial rate for the unsubstituted benzenethiol. Further, Hammett plot was generated by plotting logarithms of initial rates of coupling constant versus substituents constant. Initial rate of coupling reactions has often used in Hammett analysis.¹

(c) 4-fluorothiophenol

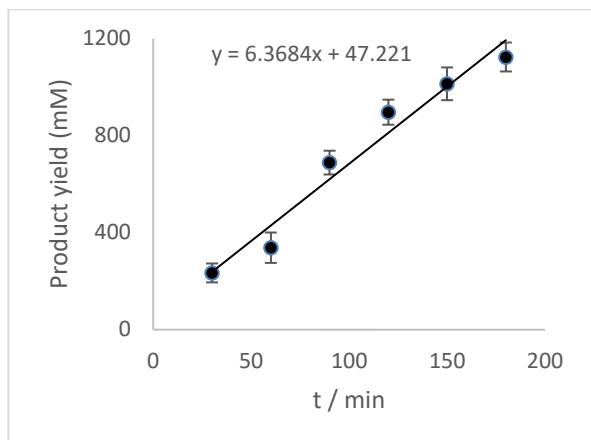

Figure S4: Initial rate for the reactions between (a) 4-methoxythiophenol, (b) 4-chlorothiophenol, (c) 4-fluorothiophenol with iodobenzene.

Table S5: Initial rate for the C–S coupling of substituted thiophenols with iodobenzene

Substrate	Initial Rate (mM/min)
Thiophenol	6.97 (From Figure S5)
4-methoxythiophenol	8.05
4-methylthiophenol	7.87
4-chlorothiophenol	6.20
4-fluorothiophenol	6.36

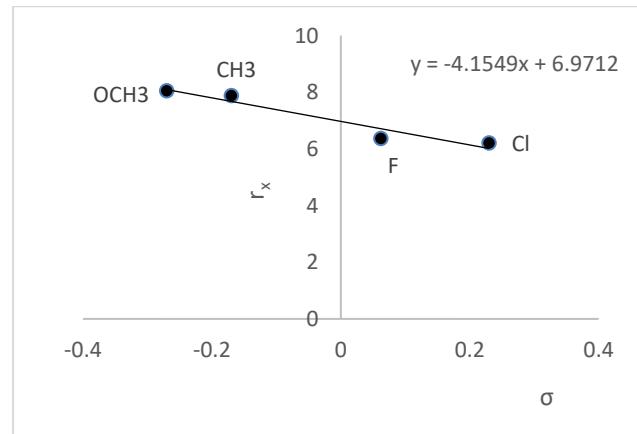

Figure S5: Plot of Initial rate (r_x) versus substituent constant (σ).

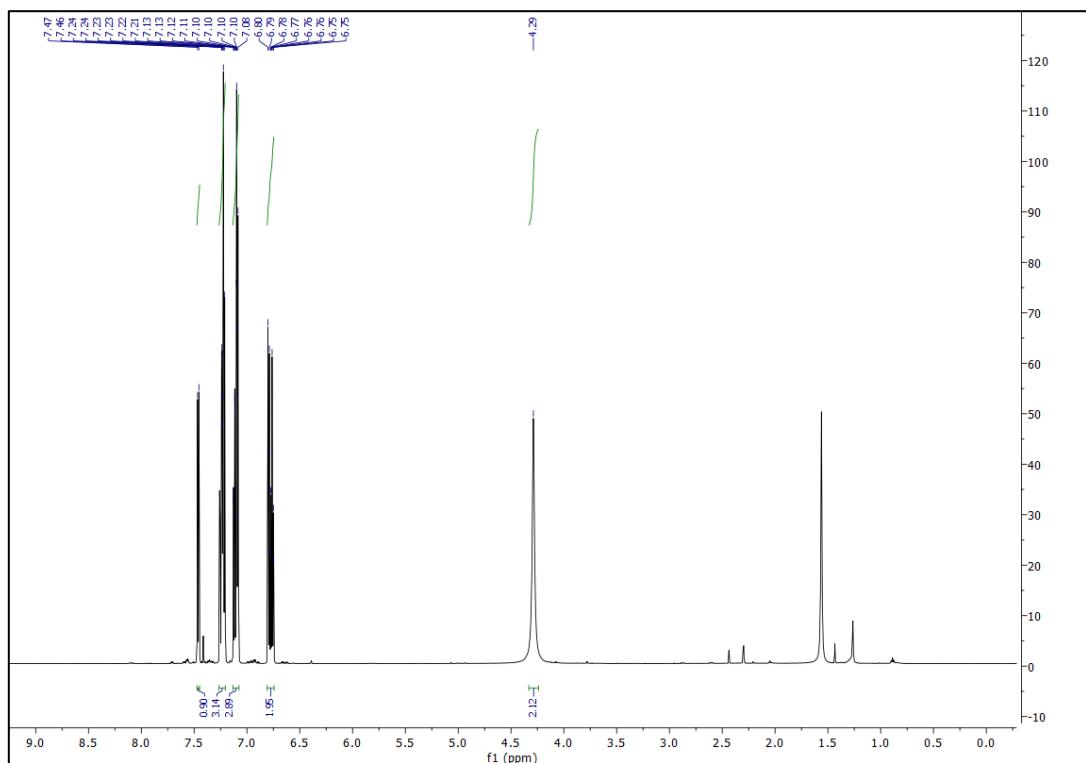

8. Kinetics data for the Hammett plot with the variation of thiophenols

Table S6: Hammett parameter, initial rate, and relevant calculated data for C-S coupling reaction between substituted thiophenols with iodobenzene.

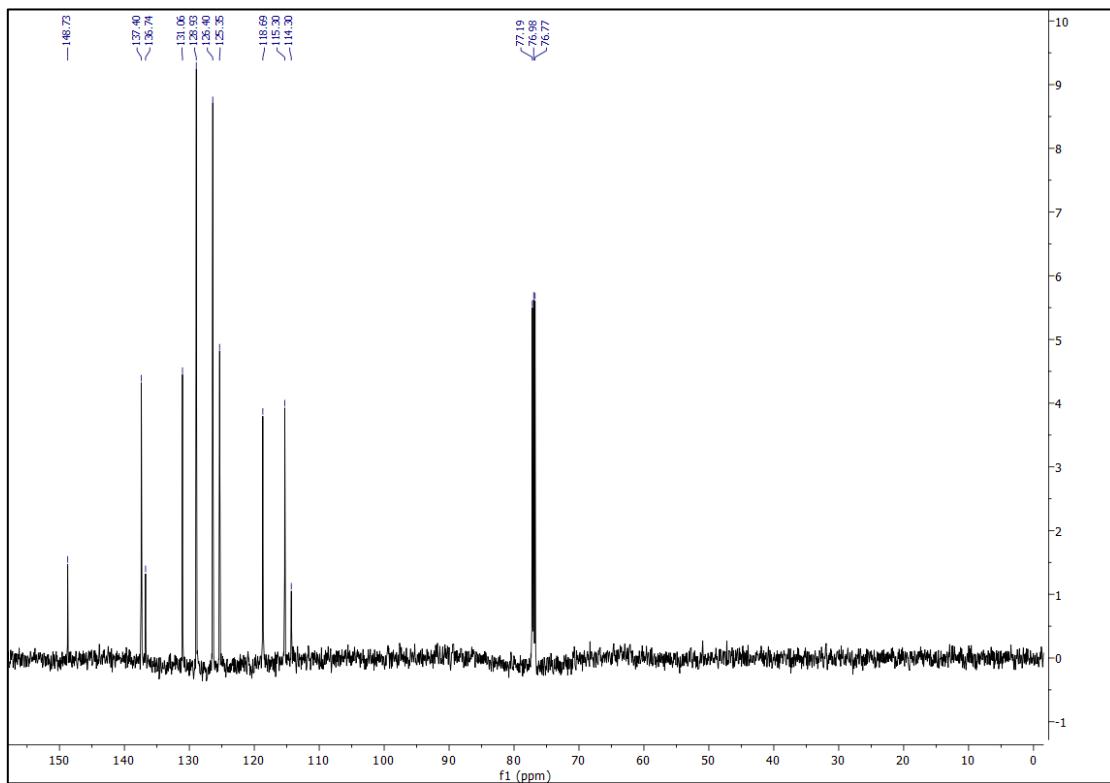

Substrate	Hammett σ_p parameter	Initial rate (mM/min)	r_x/r_H	$\log(r_x/r_H)$
Thiophenol	0	6.97	1	0
4-methoxythiophenol	-0.27	8.05	1.154765	0.062494
4-methylthiophenol	-0.17	7.87	1.12982	0.053009
4-chlorothiophenol	0.23	6.20	0.890105	-0.05056
4-fluorothiophenol	0.25	6.36	0.91353	-0.03928
