Computational Methods

The computations for **the non-anionic systems** were performed as follows:

1. Geometry optimizations were carried out without symmetry constraints using M06-L density functional¹ and tight convergence criteria as implemented in the Gaussian 09 E.01 package.² The def2-TZVPP³ all-electron triple-zeta basis set of the Karlsruhe group was used together with the corresponding fitting basis set⁴ and effective core potentials. The D3 version of Grimme's dispersion correction with the original D3 damping function was applied.⁵ A pruned (99, 590) integration grid (UltraFine) was used. Frequency calculations were performed to confirm the nature of the stationary points to yield one imaginary frequency for the transition states and none for the minima. Gas-phase thermochemical parameters at 298.15 K (E, H, and G_{uncorr.}) were obtained from the frequency calculations.
2. The Gibbs free energies (G_{uncorr.}) were corrected using the quasi-harmonic approximation⁶ and to a solution-phase standard state as implemented in the GoodVibes 3.0.1 program⁷ (corrected values were reported as G).
3. The solvent corrections were considered using the SMD solvation model⁸ and acetone as a solvent. The corresponding calculations were performed on the gas-phase geometries, and the solvation energies were evaluated as the difference between the SMD (E_{solv}) and gas-phase electronic energies; then, the obtained earlier thermochemical parameters were corrected using the solvation energies (H_{solv} = H + E_{solv} - E; G_{solv} = G + E_{solv} - E).⁹
4. The gas-phase domain-based local pair natural orbital coupled-cluster theory with single-, double-, and perturbative triple excitations (DLPNO-CCSD(T))¹⁰ electronic energies (E_{CC}) were obtained using "TightPNO" default convergence thresholds, and tight SCF convergence criteria as implemented in the ORCA 4.2.1 code.¹¹ The def2-TZVPP orbital basis set was used together with the corresponding auxiliary basis set for correlated methods (def2-TZVPP/C¹²). Additionally, the iterative full LMP2 guess was requested.
5. Finally, the solvent-corrected DLPNO-CCSD(T) Gibbs free energies were evaluated as G_{CC} = E_{CC} + G_{solv} - E. These values were used for the analysis and production of energy diagrams.

The corresponding computations for **the anionic systems** and for all **the systems involved in a reaction step together with an anionic system** (i.e., when the corresponding energies are subtracted; such cases are denoted with the quotation mark ('') after an identifier) were performed using the abovementioned methods with the following differences:

1. Geometry optimizations were performed using the ORCA 4.2.1 code. The minimally augmented def2-TZVPP basis set (ma-def2-TZVPP¹³) was used. The other options were chosen similarly to the case of the non-anionic systems: M06-L density functional, tight geometry and SCF convergence criteria, Lebedev

590 points grid, D3 version of Grimme's dispersion correction, and SMD solvation model for acetone as a solvent. Additionally, the RI-J approximation with an automatically generated auxiliary basis set¹⁴ was invoked.

2. The obtained gas-phase Gibbs free energies were not corrected manually using the quasi-harmonic approximation because ORCA performs this correction by default. The resulted values were corrected to a solution-phase standard state by adding +0.00301640938 Eh (which is equal to $R \times T \times \ln(24.46)$, where 24.46 stands for the molar volume at 1 atm and 298.15 K). The corrected values were reported as G.

3. The DLPNO-CCSD(T) computations were performed using the ma-def2-TZVPP basis set and an automatically generated auxiliary basis set for correlated methods.

With the mean absolute deviations for the bond distances and angles of 0.021 Å and 1.73 ° (Table S2), respectively, the used approach provides the structures of the quality comparable to those from the classical hybrid¹⁵ or recently developed functionals, such as r²SCAN-3c.¹⁶

The nuclei movements corresponding to the single imaginary frequencies were visualized and analyzed for all found transition states. In difficult cases (**TS_1_IM8**, **TS_IM1_IM2**, **TS_3_IM13**, **TS_IM9_IM10**), the reaction path was traced from the transition state to the product and back to the reactant by using the Intrinsic Reaction Coordinate method.¹⁷ In the case of a barrierless step, the corresponding transition state cannot be localized (**TS_IM2_IM3**, **TS_IM7_2**, **TS_IM6_IM7'**, **TS_IM13_IM14**, **TS_IM14_IM15**, **TS_IM15_4**), and the relaxed potential energy surface scan was performed to ensure that the surface was smooth (the single key geometrical parameter was varied with a step of 0.04 Å).

Supplementary Data for Discussion

Table S1. Changes in solvent-corrected DLPNO-CCSD(T) Gibbs free energies (ΔG_{CC}) given for reactions of complexes bearing different halogens, in kcal mol⁻¹.

| Reaction step | X = Cl | X = Br | X = I |
|-------------------------------|---------------|---------------|--------------|
| 1:X + PO → IM1:X | -5.25 | -6.12 | -4.21 |
| TS(1:X + PO → IM1:X) | 17.23 | 16.11 | 17.25 |
| IM1:X → IM2:X | 3.83 | 8.83 | 7.35 |
| TS(IM1:X → IM2:X) | 18.51 | 21.79 | 14.87 |
| 1:X → IM8:X | 18.76 | 23.16 | 16.82 |
| TS(1:X → IM8:X) | 20.59 | 26.99 | 20.29 |
| IM6:X' → IM7' + X' | 7.14 | 12.41 | 7.16 |

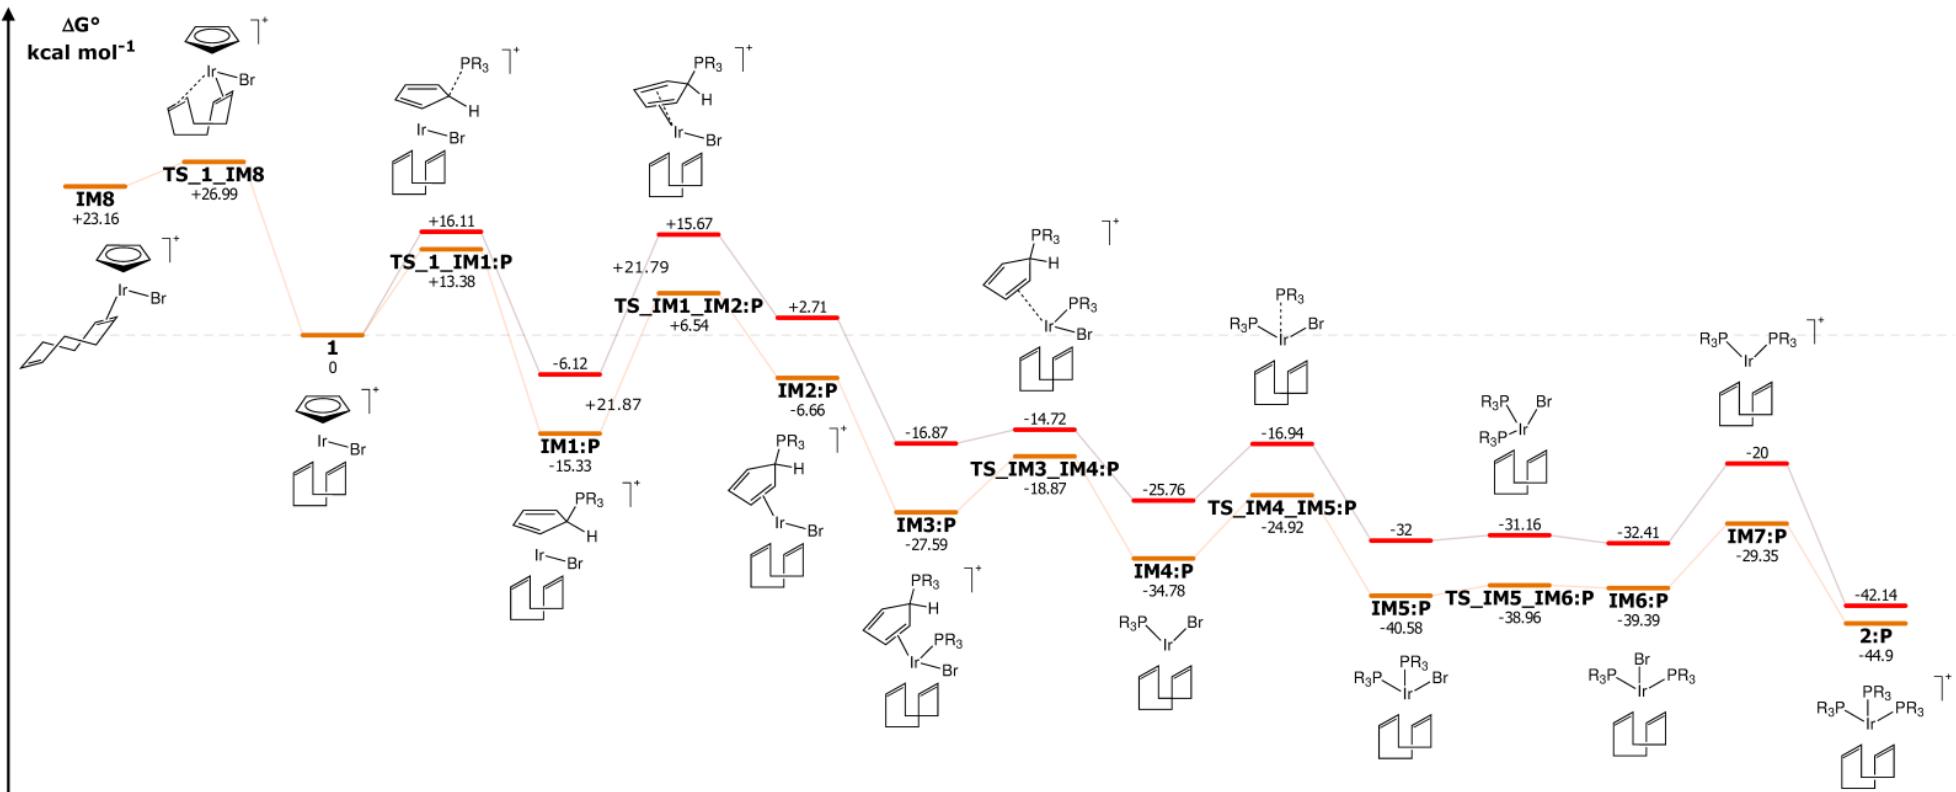

Figure S1. Energy diagram for reaction of **1** with phosphine ($\text{PR}_3 = \text{PMe}_3$) leading to **2:P** (shown in orange). Corresponding levels for reaction with phosphite ($\text{PR}_3 = \text{P}(\text{OMe})_3$) are given in red for comparison.

Comparison of Optimized and XRD Geometries

Table S2. Selected bond lengths (d, Å) and angles (ω , °) obtained from XRD and optimized structures. CCDC deposition numbers and references are provided for each compound. Cp and C=C stand for the centroids of Cp ring and carbon–carbon double bond, respectively. The mean absolute deviations for d and ω are equal to 0.021 Å and 1.73 °, respectively.

| Parameter | XRD value(s) | Calculated value(s) | Deviation(s) |

Identifiers and Visual Representations of Optimized Structures

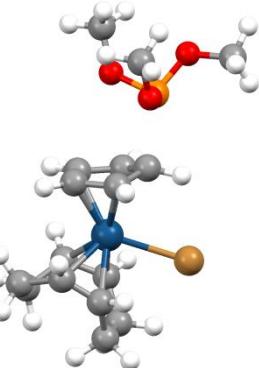

- Visual representations of the compounds are given after this note. The labels contain the **identifiers**, text formulas, and numbers of valence electrons of iridium in brackets. The cartesian coordinates of atoms are provided as a supplementary material.
- The quotation mark (') after an identifier implies that the associated computations were performed using a diffuse basis set (ma-def2-TZVPP) instead of def2-TZVPP (see the “computational methods” Section of this document).
- The compounds bearing –Br and/or –P(OMe)₃ fragments are abbreviated without any transcript after the colon. On the contrary, the variation of the halogen (**:Cl**, **:I**) and/or nucleophile (**:P**, **:bipy**) is given after the colon.
- In this way, the reactants and products are abbreviated with the following identifiers: [CpIr(COD)Br]⁺ (**1**), [CpIr(COD)Cl]⁺ (**1:Cl**), [CpIr(COD)I]⁺ (**1:I**), [(COD)Ir(P(OMe)₃)₃]⁺ (**2**), [(COD)Ir(PMe₃)₃]⁺ (**2:P**), [Cp*Ir(COD)Br]⁺ (**3**), [Cp*Ir(P(OMe)₃)₂Br]⁺ (**4**), P(OMe)₃ (**PO**), [C₅H₅P(OMe)₃]⁺ (**diene**), PMe₃ (**P**), [C₅H₅PM₃]⁺ (**diene:P**), COD (**COD**), bipy (**bipy**), Cl⁻ (**Cl'**), Br⁻ (**Br'**), and I⁻ (**I'**).
- The intermediates are abbreviated following the same principles. For instance, the intermediates **IM1–15**, **IM1'**, **IMs'**, **IM6'**, and **IM7'** have –Br and/or –P(OMe)₃ fragments in the structure. On the contrary, the intermediates **IM1:Cl**, **IM1:I**, and **IM6:Cl'**, **IM6:I'** are the full analogues of **IM1** and **IM6'**, respectively, but with a halogen other than bromine. Similarly, the intermediates **IM1:bipy** and **IM1:P** have the attached nucleophile other than the P(OMe)₃.
- The transition states are abbreviated with **TS_<reactant>_<product>** identifiers, where the **<reactant>** and **<product>** indicate the initial and final intermediates, respectively, which are connected via this transition state. For instance, the transition state for the addition of **PO** to **1** with the formation of **IM1** is abbreviated as **TS_1_IM1**. For the addition of **bipy** to **1** and the addition of **PO** to **1:Cl**, the corresponding identifiers are **TS_1_IM1:bipy** and **TS_1_IM1:Cl**, respectively.
