## Experimental section

Materials and instrumentation. Chemicals are available commercially. Powder X-ray diffraction (PXRD) patterns were determined by using Rigaku Damx 2000 X-ray diffractometer with graphite monochromatized $\mathrm{Cu} \mathrm{K} \alpha$ radiation $(\lambda=0.154 \AA$ ). IR spectra were recorded with a Nicolet Magna 560 Fourier transform IR spectrometer. ICP measurements were conducted on a Leeman Laboratories Prodigy inductively coupled plasma-optical atomic emission spectrometer (ICP-AES). C, H and N contents were carried out on a Euro vector EA3000 elemental analyzer. ${ }^{1} \mathrm{H}$ NMR data were recorded in $\mathrm{CDCl}_{3}$ on a Bruker 500 MHz . X-ray photoelectron spectroscopy (XPS) was determined with an Escalab 250 instrument. Energy dispersive x-ray spectroscopy (EDS) was obtained by GeminiSEM 300 and AZtecLive UltimMax 100. TGA data was recorded on a DTG-60H under $\mathrm{N}_{2}$ atmosphere. Products of AAC reactions were detected by GC equipment with capillary ( 30 m long $\times 0.25 \mathrm{~mm}$ i.d., WondaCAP 17), and FID detector (GC-2014C, Shimadzu, Japan). Yields of catalytic reactions were measured with high performance liquid chromatography (HPLC) and gas chromatography (GC). ODS products were detected by HPLC with a UV-vis detector at $\lambda=254 \mathrm{~nm}$ using an Inertsil $(5 \mu \mathrm{~m}, 4.6 \times 150 \mathrm{~mm})$ ODS C18 column (Agilent-1220).

X-ray crystallography. Crystallographic data were measured on an Oxford Diffraction Gemini R CCD diffractometer with graphite monochromated Mo $\mathrm{K} \alpha$ radiation ( $\lambda=$ $0.71073 \AA$ ). Structures were solved by direct methods with SHELXT-2018/3 ${ }^{1}$ and refined on $\mathrm{F}^{2}$ by full-matrix least-squares with SHELXTL-2018/3 within WINGX. ${ }^{2-3}$ Non-hydrogen atom was refined anisotropically. Carbon hydrogen atoms were placed geometrically. SQUEEZE routine was applied to remove the disordered solvents. Crystallographic data of $\mathbf{1}$ and $\mathbf{2}$ are presented in Table S1. Selected bond distances and angles were provided in Table S2.

Synthesis of $\mathbf{L}_{\mathbf{1}}$. Thiacalix[4]arene precursors were synthesized according to the literature method (Scheme S 1 ). ${ }^{4,5}$ A mixture of $\mathrm{K}_{2} \mathrm{CO}_{3}(5.745 \mathrm{~g}, 50 \mathrm{mmol}$ ) and 2mercaptopyrimidine ( $2.8 \mathrm{~g}, 25 \mathrm{mmol}$ ) were dissolved in dry DMF ( 200 mL ). The
precursor $\mathrm{B}(2.805 \mathrm{~g}, 25 \mathrm{mmol})$ was added to the mixture in water bath under $\mathrm{N}_{2}$ for 12 h. After the reaction finished, the mixture was sealed in a single-necked bottle. Then the mixture was cooled and the solvent was removed. $\mathrm{L}_{1}$ ligand was obtained by filtration and washed with water for several times (yield: $79 \%$ ). ${ }^{1} \mathrm{H}$ NMR ( 500 MHz , $\mathrm{CDCl}_{3}$ ): $\delta 8.54(\mathrm{dd}, 8 \mathrm{H}), 7.51(\mathrm{~s}, 8 \mathrm{H}), 6.98(\mathrm{~m}, 4 \mathrm{H}), 4.26(\mathrm{~m}, 8 \mathrm{H}), 2.84(\mathrm{~m}, 8 \mathrm{H}), 1.12$ (s, 36H). Catalytic ODS reaction of 1 . Biphenyl ( 0.4 mmol ), $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{~mL})$, TBHP ( 1 mmol ), catalyst $\mathbf{1}(10 \mathrm{mg})$ and substrate $(0.4 \mathrm{mmol})$ were placed in a 38 mL pressure-proof pipe. The resulting mixture was stirred at $25^{\circ} \mathrm{C}$. GC or HPLC was used to record the conversion rate (Fig. S4-S8). When catalyst 1 was replaced by $\left.\left[\left(n-\mathrm{C}_{4} \mathrm{H}_{9}\right)\right)_{4} \mathrm{~N}\right]_{4}\left[\mathrm{Mo}_{8} \mathrm{O}_{26}\right]$, $\mathrm{CuCl}_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}$ and L , the corresponding catalyst doses were $7 \mathrm{mg}, 0.9 \mathrm{mg}$ and 6.5 mg , respectively.

Catalytic AAC reaction of 2. Alkynes ( 2 mmol ), amyl acetate ( 0.92 mmol ), methanol $(4 \mathrm{~mL})$, azides $(1 \mathrm{mmol})$ and $\mathbf{2}(10 \mathrm{mg})$ were placed in a 38 mL pressure-proof pipe at $70^{\circ} \mathrm{C}$ for 8 h . The conversion rate was measured with GC or HPLC. Catalytic product was further characterized with ${ }^{1} \mathrm{H}$ NMR (Fig. S10-S14). When catalyst $\mathbf{1}$ was replaced by L , the L dose was 4.7 mg .
