# PART I. Supplemental Notes

## Supplemental Note 1

For the single atom adsorption on basal plane, its thermodynamic stability is judged based on the formation energy  $E_{\text{form}}$ . When metal atoms are adsorbed on the basal plane of MoS<sub>2</sub>, the calculation formula is as follows:

$$E_{\text{form}} = E_{\text{TM-MoS}_2} - E_{\text{TM}} - E_{\text{MoS}_2}$$

For replacing Mo or S of the basal plane, the calculation formula is as follows:

$$E_{\text{form}} = E_{\text{TM-MoS}_2} + E_{\text{TM}} - E_{\text{MoS}_2} - E_{\text{Mo/S}}$$

When the metal atoms are loaded on the molybdenum disulfide edge surface, the formation energy is calculated as follows:

$$E_{\text{form}} = E_{\text{TM-MoS}_2} - E_{\text{TM}} - E_{\text{MoS}_2} - 8n * E_S$$

Among them, n refers to the coverage of S atoms, and the values are 12.5%, 25%, 37.5%, 50%.  $E_{\text{TM-MoS}_2}$ ,  $E_{\text{TM}}$ ,  $E_{\text{MoS}_2}$ , and  $E_S$  are the energies of TM-MoS<sub>2</sub>, transition metal atom from bulk, MoS<sub>2</sub> slab, and S atom from bulk after considering the coverage of S atoms, respectively.”

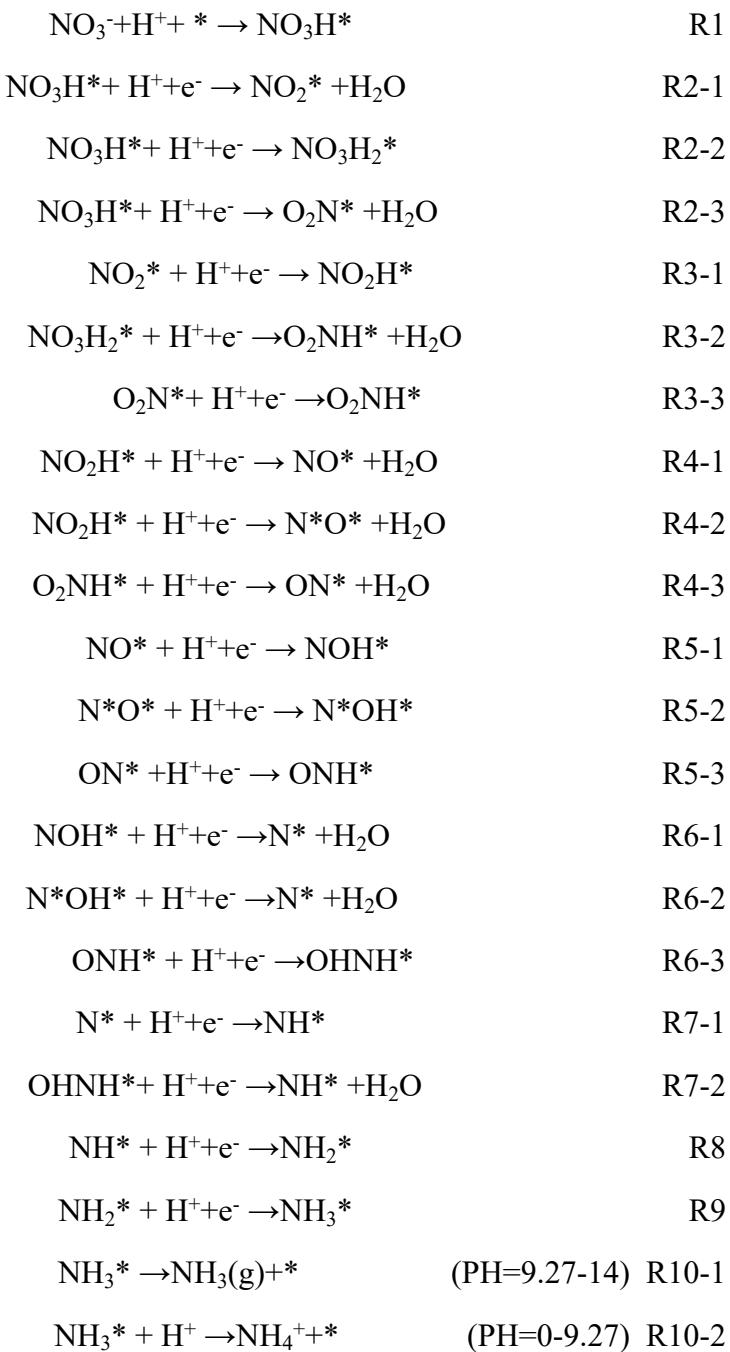

## Supplemental Note 2

To avoid calculating the energy of charged NO<sub>3</sub><sup>-</sup> directly, gaseous HNO<sub>3</sub> and H<sub>2</sub> is chosen as a reference instead<sup>[1]</sup>. The adsorption energy of NO<sub>3</sub><sup>-</sup> ( $\Delta G_{*\text{NO}_3}$ ) is described as

$$\Delta G_{*\text{NO}_3} = G_{*\text{NO}_3} - G_* - G_{\text{HNO}_3(g)} + 1/2G_{\text{H}_2(g)}$$

where  $G_{*\text{NO}_3}$ ,  $G_*$ ,  $G_{\text{HNO}_3(g)}$ , and  $G_{\text{H}_2(g)}$  are the Gibbs free energy of NO<sub>3</sub><sup>-</sup> adsorbed on substrates, as well as HNO<sub>3</sub> and H<sub>2</sub> molecules in the gas phase, respectively. The adsorption free energy of other intermediates on SACs were also calculated by taking gaseous HNO<sub>3</sub> and H<sub>2</sub> as a reference.

## Elementary steps of NO<sub>3</sub>RR

For each intermediate, the calculation of free energy is shown as follow.

$$G(*) = E(*) + ZPE + T\Delta S$$

For each elementary step, the Gibbs reaction free energy  $\Delta G$  is the difference between the free energies of the reactants and products, and is expressed as follows. Since electron transfer is involved in the elementary reaction step and the reaction uses RHE

as the reference electrode,  $G(H^+ + e^-) = 1/2G_{H_2}$ .

$$\Delta G_1^0 = G(NO_3H^*) - G(NO_3^-) - G(H^+ + e^-)$$

$$\Delta G_{2-1}^0 = G(NO_2^*) + G(H_2O) - G(NO_3H^*) - G(H^+ + e^-)$$

$$\Delta G_{2-2}^0 = G(NO_3H_2^*) - G(NO_3H^*) - G(H^+ + e^-)$$

$$\Delta G_{2-3}^0 = G(O_2N^*) + G(H_2O) - G(NO_3H^*) - G(H^+ + e^-)$$

$$\Delta G_{3-1}^0 = G(NO_2H^*) - G(NO_2^*) - G(H^+ + e^-)$$

$$\Delta G_{3-2}^0 = G(O_2NH^*) + G(H_2O) - G(NO_3H_2^*) - G(H^+ + e^-)$$

$$\Delta G_{3-3}^0 = G(O_2NH^*) - G(O_2N^*) - G(H^+ + e^-)$$

$$\Delta G_{4-1}^0 = G(NO^*) + G(H_2O) - G(NO_2H^*) - G(H^+ + e^-)$$

$$\Delta G_{4-2}^0 = G(N^*O^*) + G(H_2O) - G(NO_2H^*) - G(H^+ + e^-)$$

$$\Delta G_{4-3}^0 = G(ON^*) + G(H_2O) - G(O_2NH^*) - G(H^+ + e^-)$$

$$\Delta G_{5-1}^0 = G(NOH^*) - G(NO^*) - G(H^+ + e^-)$$

$$\Delta G_{5-2}^0 = G(N^*OH^*) - G(N^*O^*) - G(H^+ + e^-)$$

$$\Delta G_{5-3}^0 = G(ONH^*) - G(ON^*) - G(H^+ + e^-)$$

$$\Delta G_{6-1}^0 = G(N^*) + G(H_2O) - G(NOH^*) - G(H^+ + e^-)$$

$$\Delta G_{6-2}^0 = G(N^*) + G(H_2O) - G(N^*OH^*) - G(H^+ + e^-)$$

$$\Delta G_{6-3}^0 = G(OHNH^*) - G(ONH^*) - G(H^+ + e^-)$$

$$\Delta G_{7-1}^0 = G(NH^*) - G(N^*) - G(H^+ + e^-)$$

$$\Delta G_{7-2}^0 = G(NH^*) + G(H_2O) - G(OHNH^*) - G(H^+ + e^-)$$

$$\Delta G_8^0 = G(NH_2^*) - G(NH^*) - G(H^+ + e^-)$$

$$\Delta G_9^0 = G(NH_3^*) - G(NH_2^*) - G(H^+ + e^-)$$

$$\Delta G_{10-1}^0 = G(*) + G(NH_3) - G(NH_3^*)$$

$$\Delta G_{10-2}^0 = G(*) + G(NH_4^+) - G(NH_3^*) - G(H^+)$$

Correction of pH to Gibbs free energy<sup>[2]</sup>, where  $k_B$  is the Boltzmann constant and T is the room temperature.

$$\Delta G_1 = \Delta G_1^0$$

$$\Delta G_2 = \Delta G_2^0 + k_B T \ln 10 \times \text{pH}$$

$$\Delta G_3 = \Delta G_3^0 + k_B T \ln 10 \times \text{pH}$$

$$\Delta G_4 = \Delta G_4^0 + k_B T \ln 10 \times \text{pH}$$

$$\Delta G_5 = \Delta G_5^0 + k_B T \ln 10 \times pH$$

$$\Delta G_6 = \Delta G_6^0 + k_B T \ln 10 \times pH$$

$$\Delta G_7 = \Delta G_7^0 + k_B T \ln 10 \times pH$$

$$\Delta G_8 = \Delta G_8^0 + k_B T \ln 10 \times pH$$

$$\Delta G_9 = \Delta G_9^0 + k_B T \ln 10 \times pH$$

$$\Delta G_{10} = \Delta G_{10}^0$$

### Supplemental Note 3

HER is regarded as the most competitive reaction to NO<sub>3</sub>RR<sup>[3]</sup>. If we assume: (1) the mass and electron transfer are not the rate determining factors for both HER and NO<sub>3</sub>RR, (2) only HER and NO<sub>3</sub>RR are competing reactions, and (3) the selectivity of NO<sub>3</sub>RR in comparison to HER could be estimated by Boltzmann distribution, the Faradaic efficiency of NO<sub>3</sub>RR can be expressed as:

$$f_{\text{NO}_3\text{RR}} = \frac{1}{1 + e^{\frac{-\delta G}{k_B T}}} \times 100\%$$

where  $\delta G$  is Gibbs free energy difference between HER and NO<sub>3</sub>RR potential determining step,  $k_B$  is the Boltzmann constant, and  $T$  is the room temperature.

### Supplemental Note 4

We evaluated the thermodynamic and electrochemical stabilities of these 16 SA-MoS<sub>2</sub> monolayers by the formation energy  $E_f$  and dissolution potential  $U_{diss}$ , which are defined as<sup>[4]</sup>

$$E_f = E_{\text{TM-MoS}_2} - E_{\text{MoS}_2} - E_M$$

$$U_{diss} = U^\circ_{diss}(\text{metal, bulk}) - E_f/ne$$

where  $E_M$  is the total energy of metal atom in its most stable bulk structure,  $E_{\text{TM-MoS}_2}$  and  $E_{\text{MoS}_2}$  are the total energies of SA-MoS<sub>2</sub> and substrate,  $U^\circ_{diss}(\text{metal, bulk})$  and  $n$  are the standard dissolution potential from bulk metal to solute and the number of electrons involved in the dissolution process, respectively. The values of  $E_f$  and  $U_{diss}$  are listed in **Table S28**.

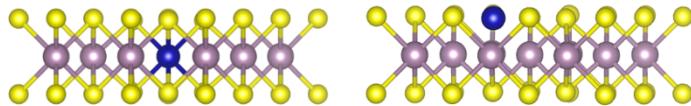

## Supplemental Note 5

In this section, we construct a chemical-potential-based thermodynamic model to explore how to improve the stability of SAs under realistic conditions. Its chemical potential  $\mu_{NP}(R)$  can be expressed by the Gibbs–Thomson (G-T) relation, as shown in<sup>[5]</sup>

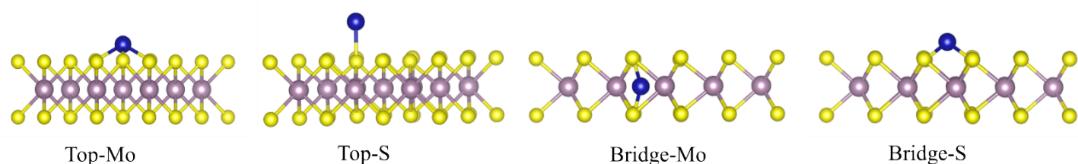

$$\begin{aligned}\mu_{Np}(R) &= 2\Omega\gamma_{me}/R \\ \mu_{SA} &\approx E_{SA/ox} - E_B - E_{ox} \\ \Delta E_{SA}^f(R) &= \mu_{SA} - \mu_{Np}(R)\end{aligned}$$

where  $E_{SA/ox}$  is the total energy of metal SA absorbed on an oxide surface,  $E_B$  the energy of bulk metal per atom, and  $E_{ox}$  the energy of the slab.

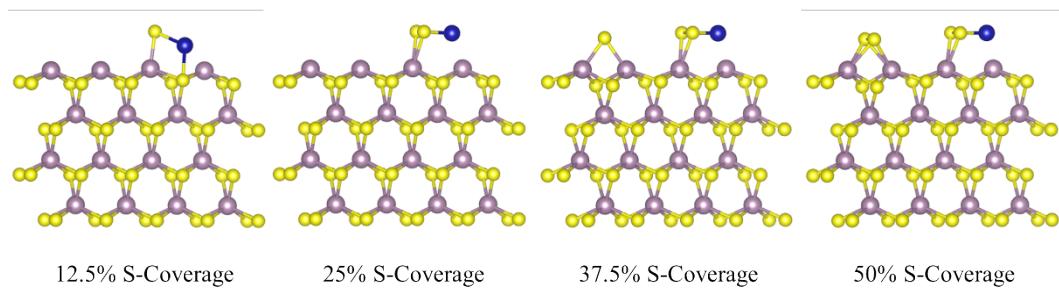

## PART II. Supplemental Figures

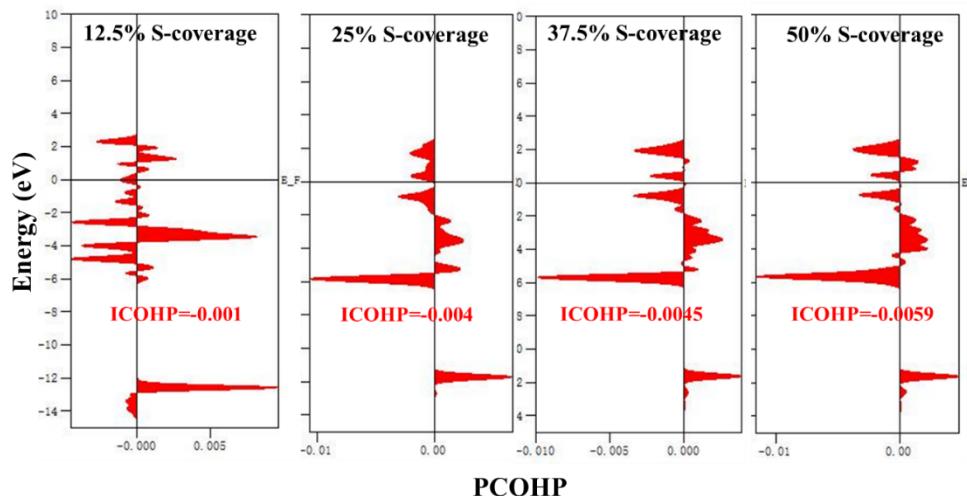

**Supplementary Figure 1.** Side view of the structures of TM (Fe, Co, Ni, Mn) replacing Mo and S atom of basal-MoS<sub>2</sub>.

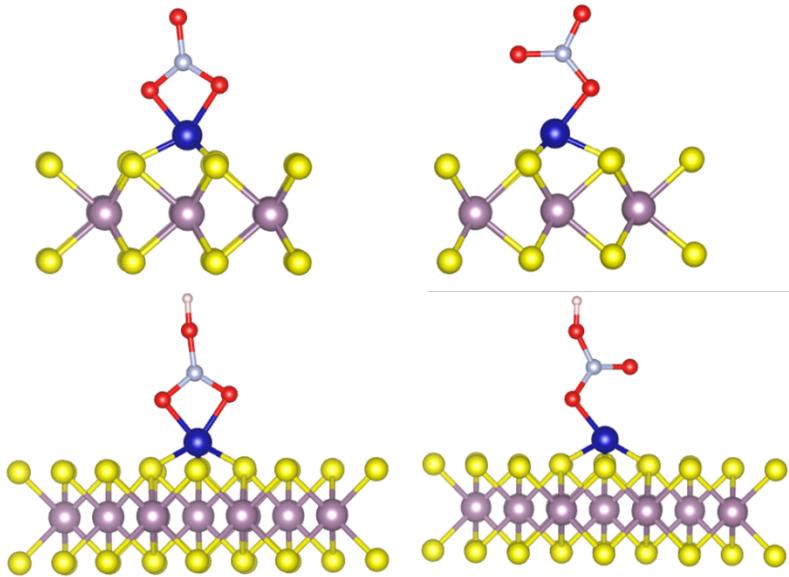

**Supplementary Figure 2.** Side view of the structures of TM (Fe, Co, Ni, Mn) adsorbed on different sites of basal-MoS<sub>2</sub>.

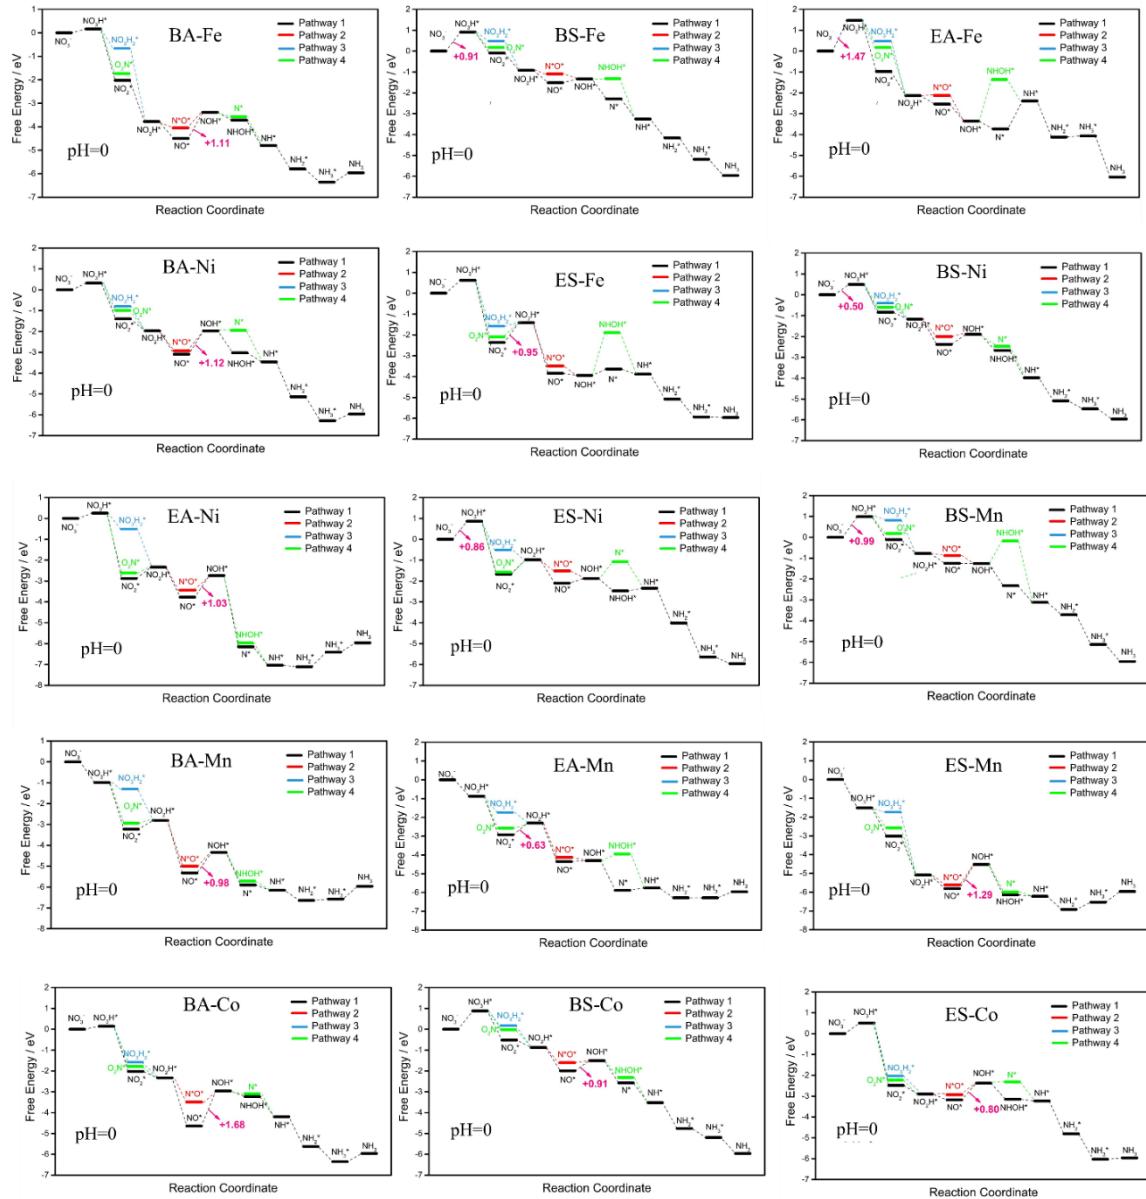

**Supplementary Figure 3.** Side view of the structures of TM (Fe, Co, Ni, Mn) embedded on different coverage of S atoms of edge-MoS<sub>2</sub>.

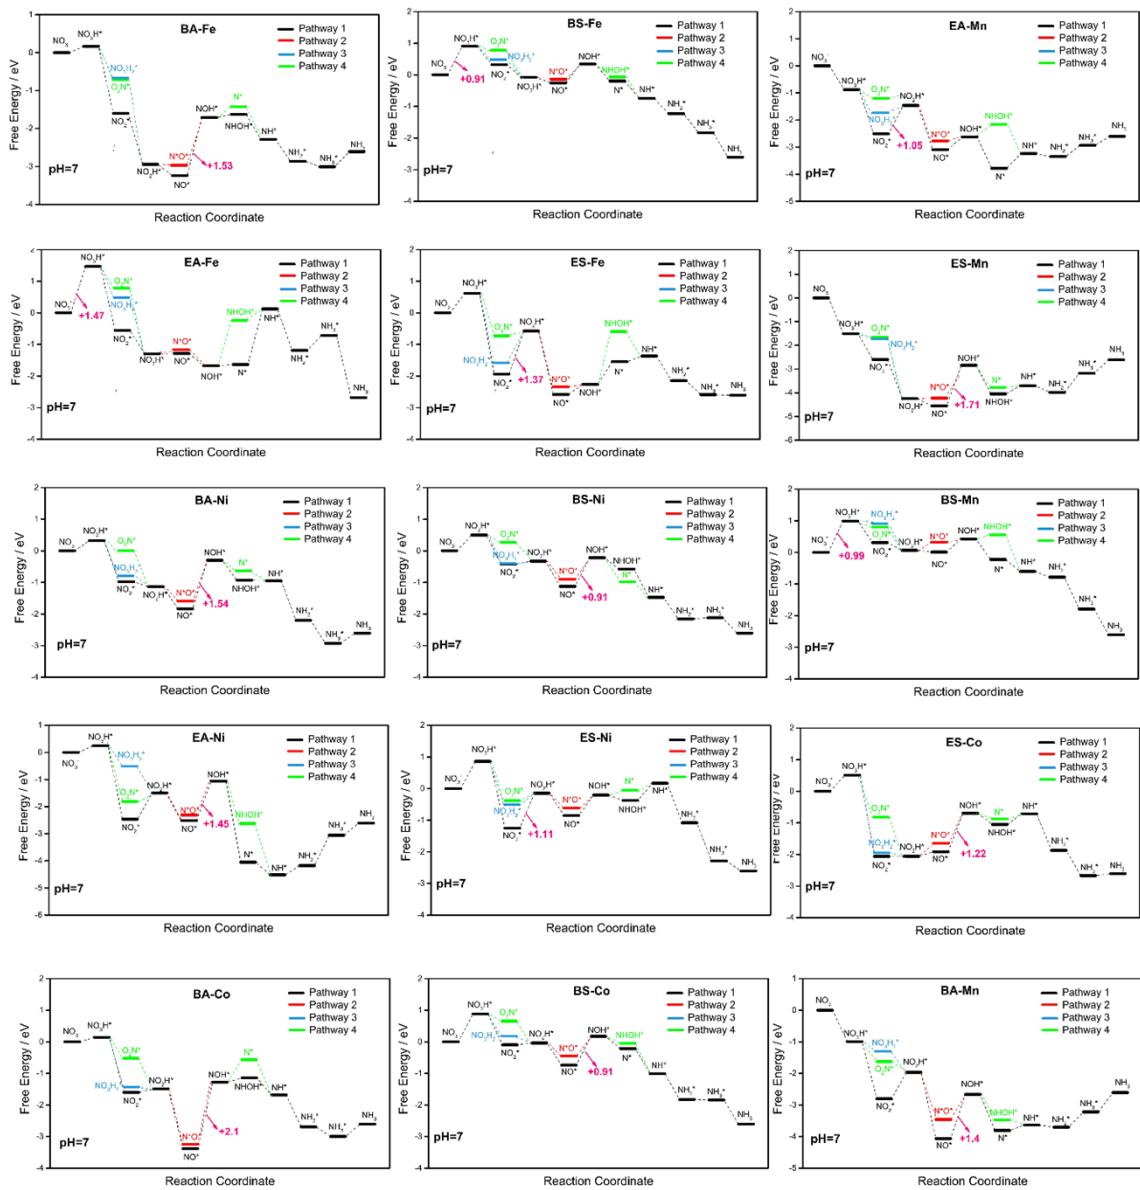

**Supplementary Figure 4.** The crystal orbital Hamilton populations (COHPs) of Co adsorbed on different coverage of S atoms of edge-MoS<sub>2</sub>. The bonding contribution of Co-S in COHP are depicted by red.

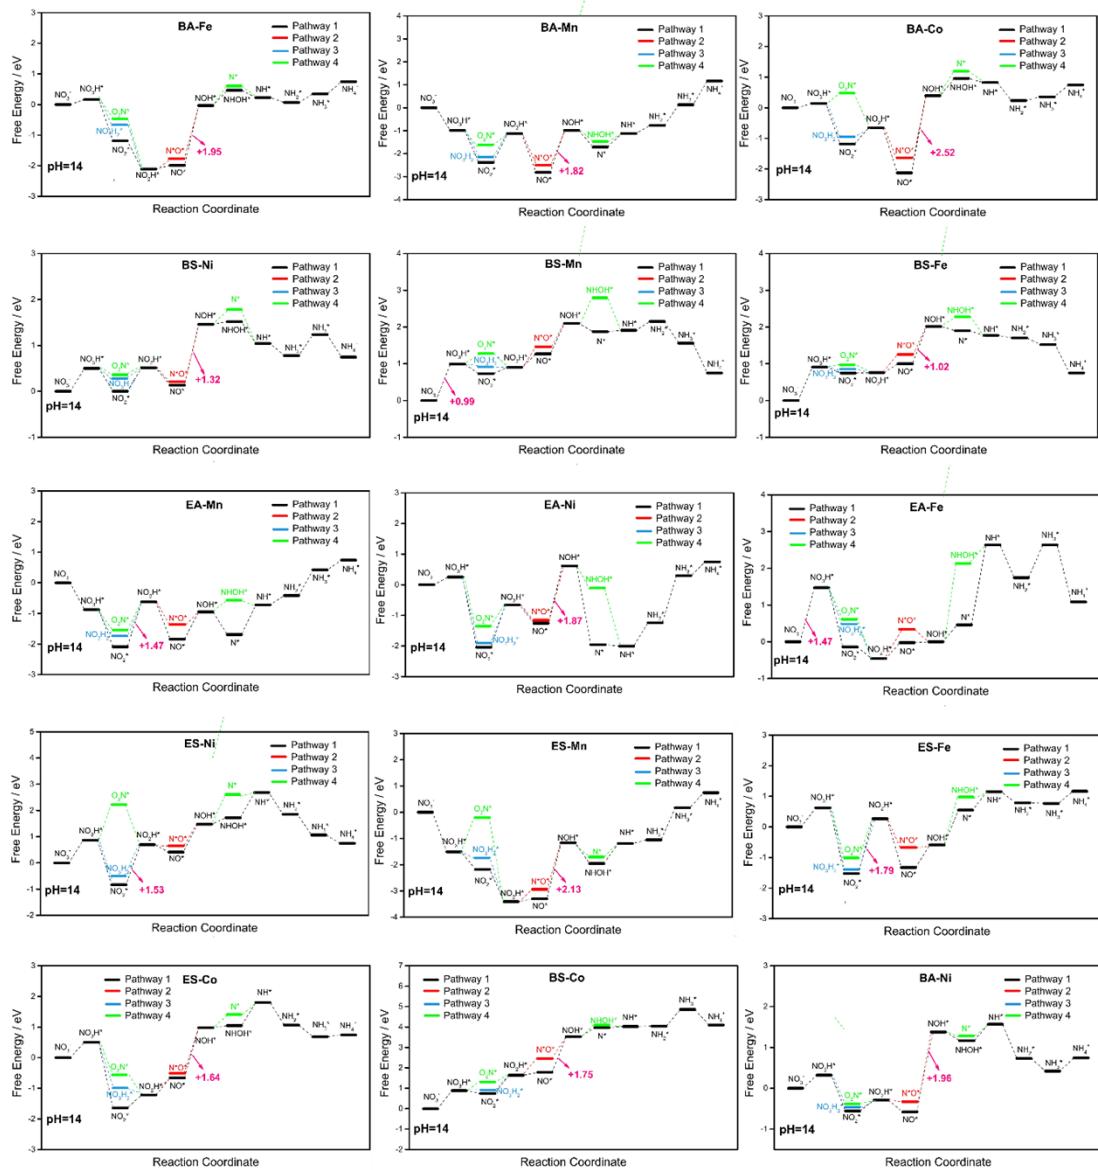

**Supplementary Figure 5.** Two configurations (1-O, 2-O) of NO<sub>3</sub> and NO<sub>3</sub>H. The spheres with various colors represent Metal (blue), O (red), N (grey), and H (white).

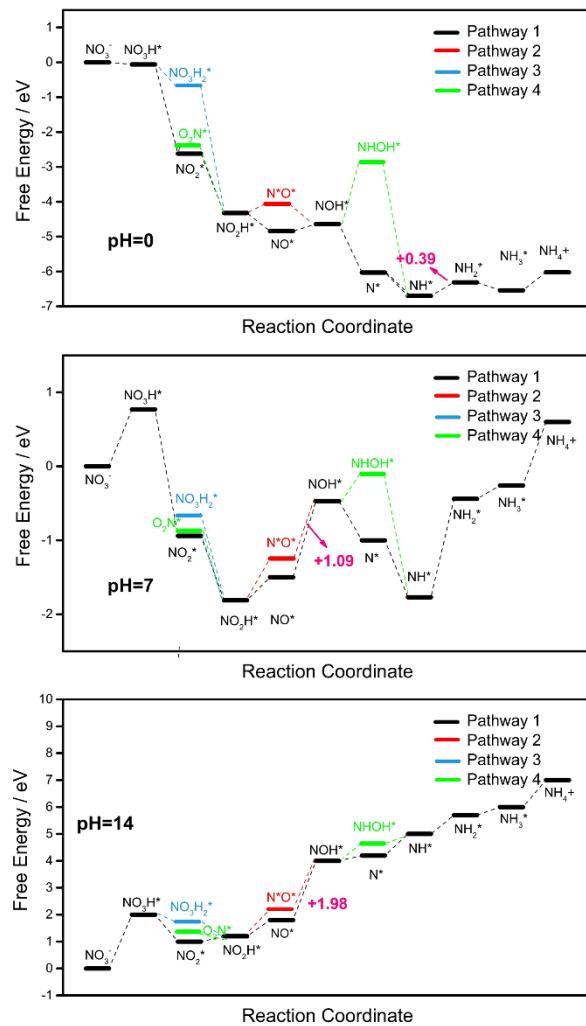

**Supplementary Figure 6.** Free energy diagrams of  $\text{NO}_3\text{RR}$  via the four pathways on SA-MoS<sub>2</sub> at pH=0, respectively.

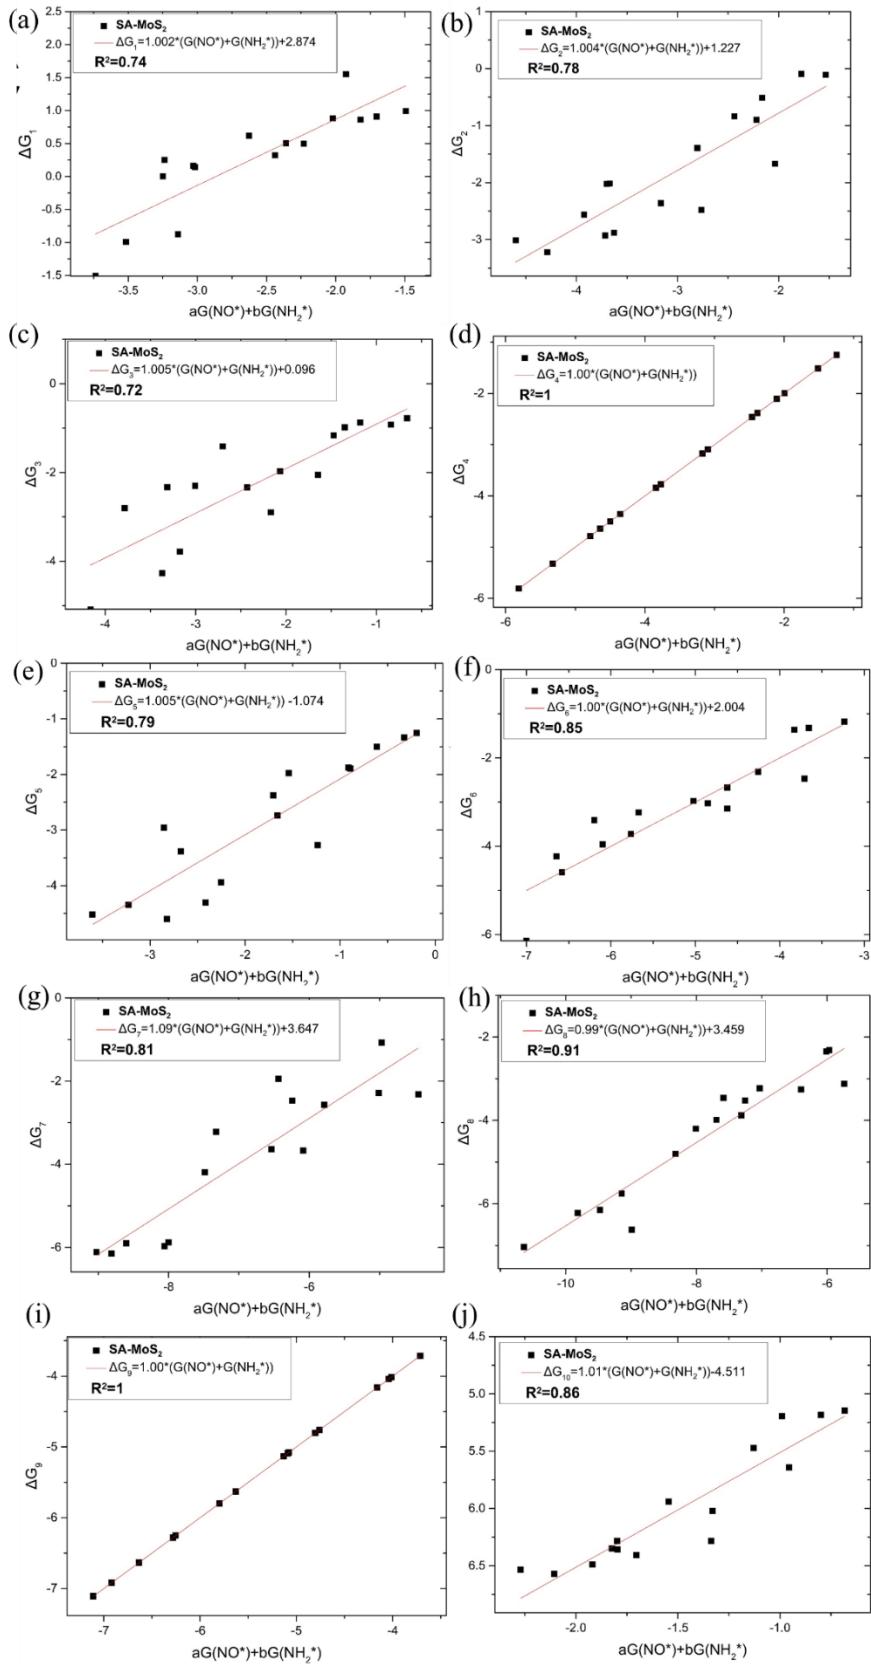

**Supplementary Figure 7.** Free energy diagrams of NO<sub>3</sub>RR via the four pathways on SA-MoS<sub>2</sub> at pH=7, respectively.

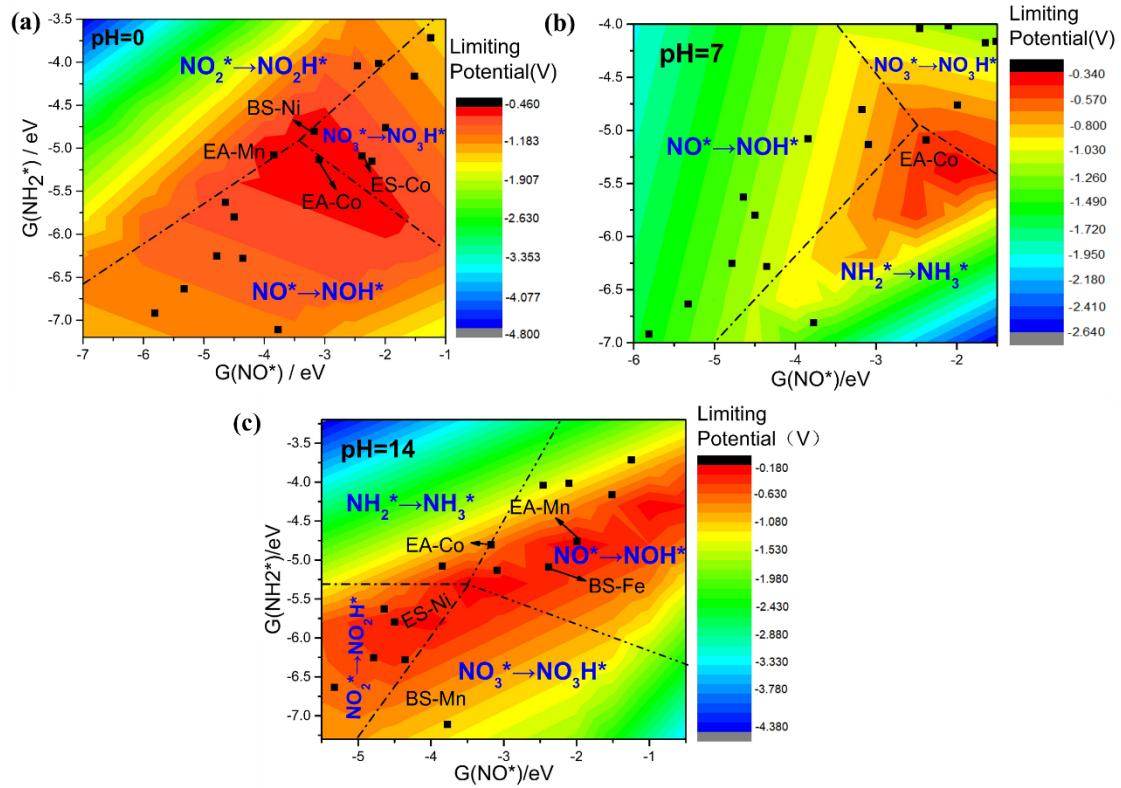

**Supplementary Figure 8.** Free energy diagrams of  $\text{NO}_3\text{RR}$  via the four pathways on SA-MoS<sub>2</sub> at pH=14, respectively.

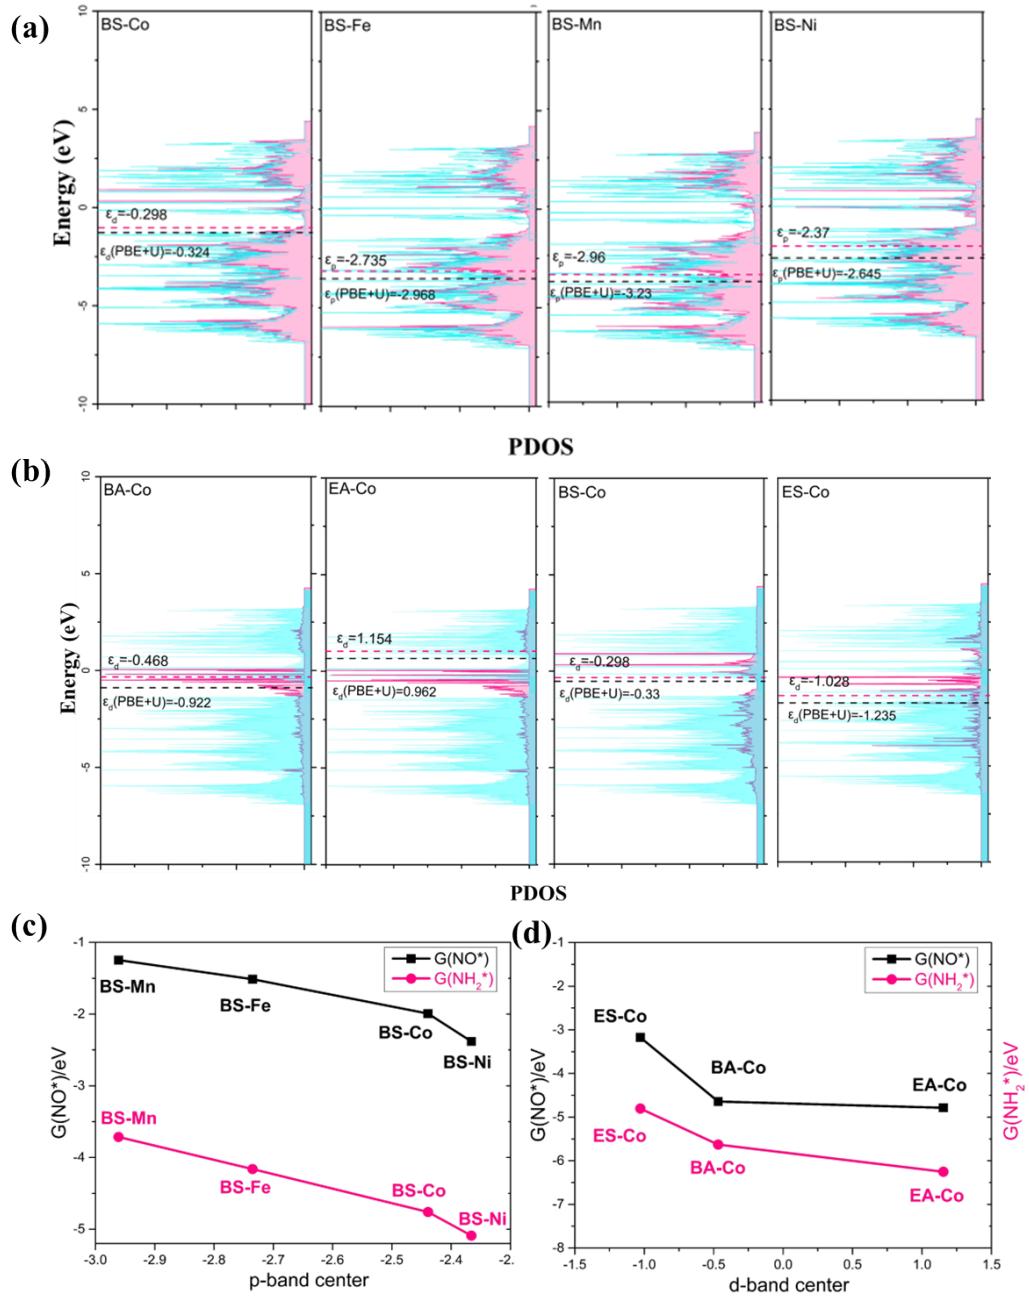

**Figure S9.** Free energies diagram of  $\text{NO}_3\text{RR}$  on EA-Co derived from PBE+U method. Four kinds of  $\text{NO}_3\text{RR}$  pathways at (a) pH = 0, (b) pH = 7, and (c) pH = 14.

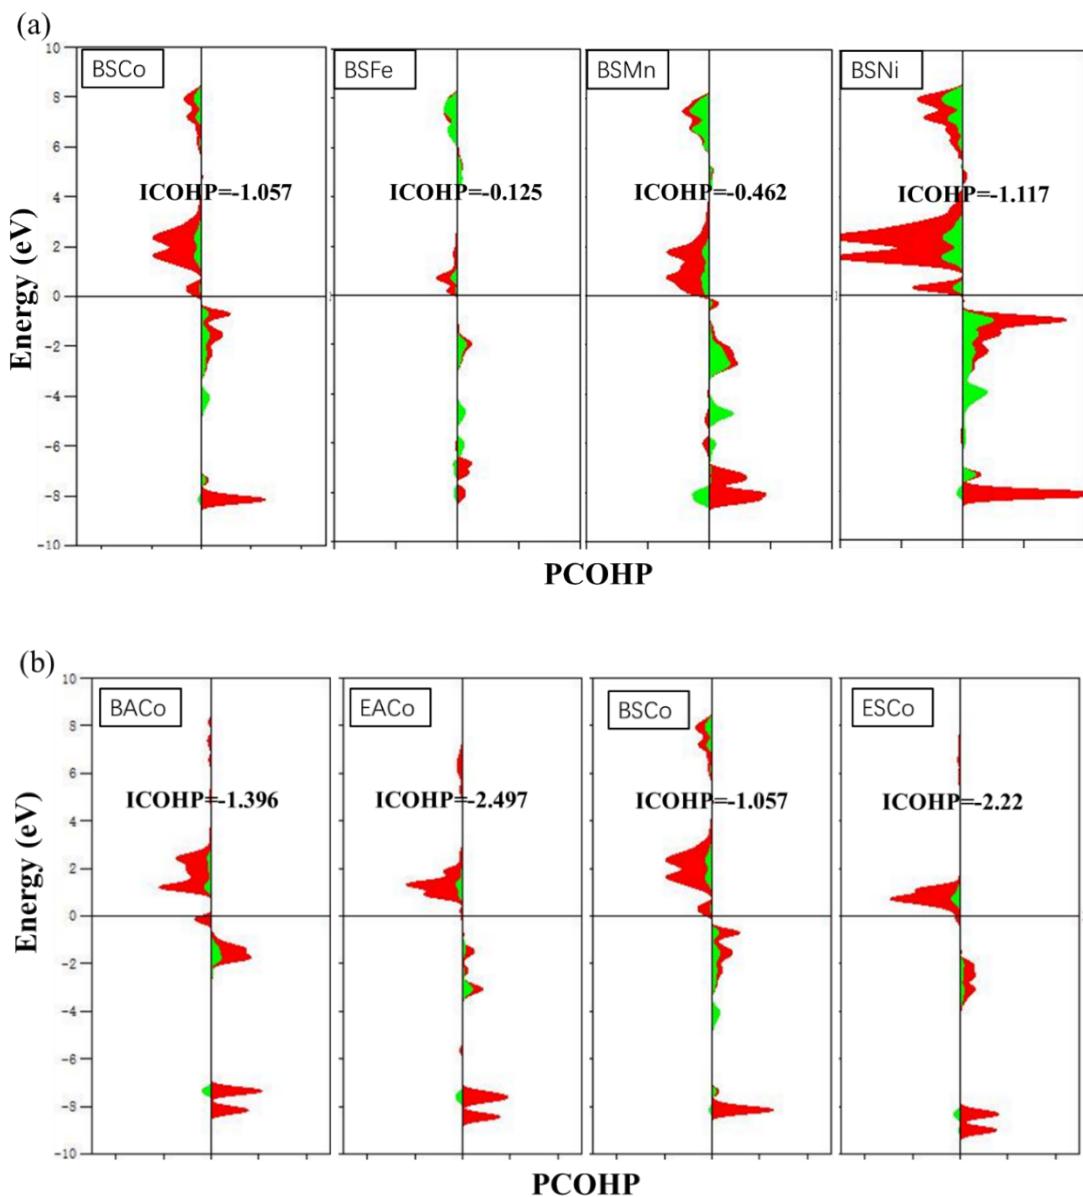

**Supplementary Figure 10.** The determined BEP scaling relations between  $(G_{\text{NO}^*}, G_{\text{NH}_2^*})$  and  $\Delta G_{1-10}$  for the nitrate reduction process. The parameters of the linear fits are provided.

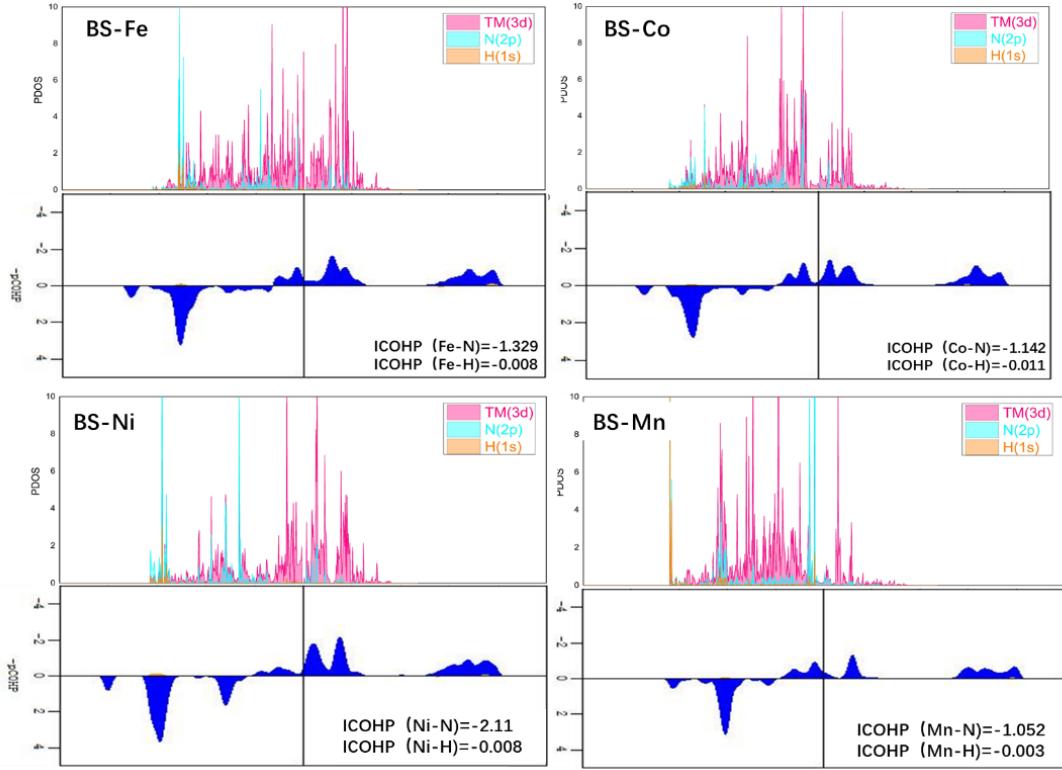

**Supplementary Figure 11.** Contour plot of limiting potential (v.s. RHE) as a function of the Gibbs adsorption free energy of  $*\text{NO}$  ( $G(\text{NO}^*)$ ) and  $*\text{NH}_2$  ( $G(\text{NH}_2^*)$ ) at (b) pH = 0, (c) pH = 7, and (d) pH = 14.

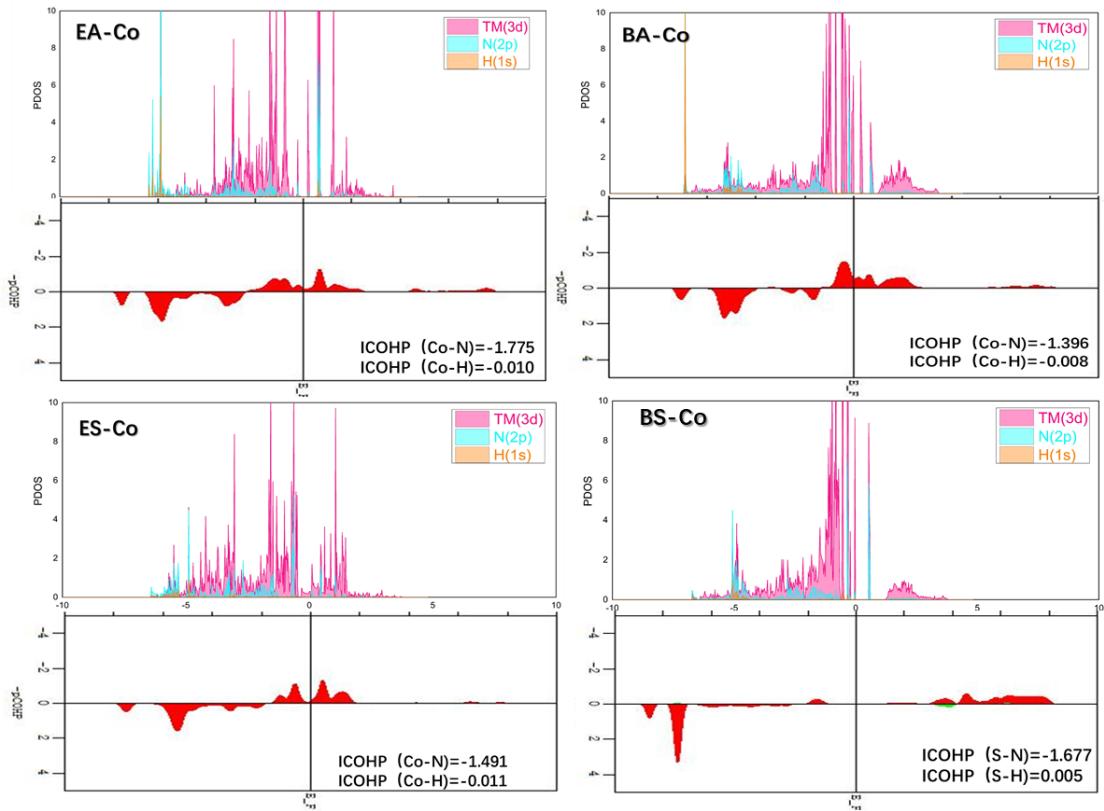

**Supplementary Figure 12.** a) The computed partial density of states (PDOS) of p-orbitals of S atom in BS-TM (TM=Fe, Co, Ni, Mn). b) The computed partial density of states (PDOS) of d-orbitals of Co atom in ES, BS, BA, EA-Co. c) Correlation between the p-band center of S atoms for BS-TM and  $G(\text{NO}^*)$ ,  $G(\text{NH}_2^*)$ . The computed partial density of states (PDOS) by PBE and PBE+U methods are depicted by pink and blue, respectively. d) Correlation between the d-band center of Co single atoms on diverse support sites and  $G(\text{NO}^*)$ ,  $G(\text{NH}_2^*)$ .

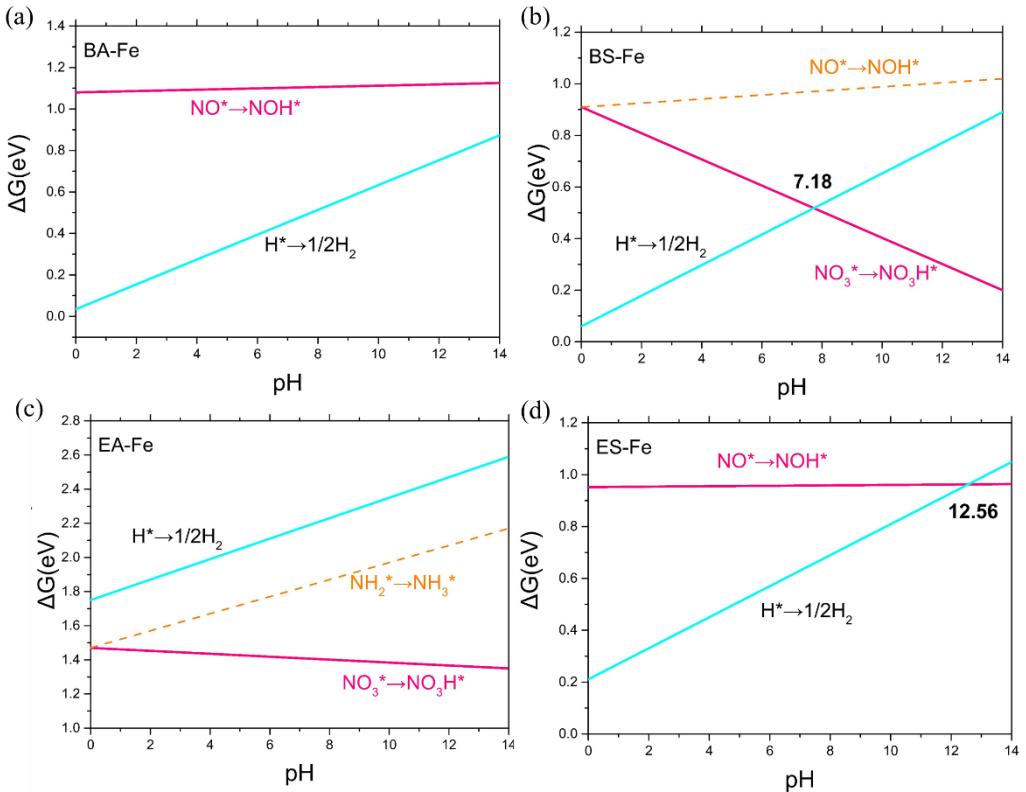

**Supplementary Figure 13.** The crystal orbital Hamilton populations (COHPs) of NO\* in BS-TM (TM=Fe, Co, Ni, Mn) and ES, BS, BA, EA-Co. The bonding contribution of N and O in COHP are depicted by red and green, respectively.

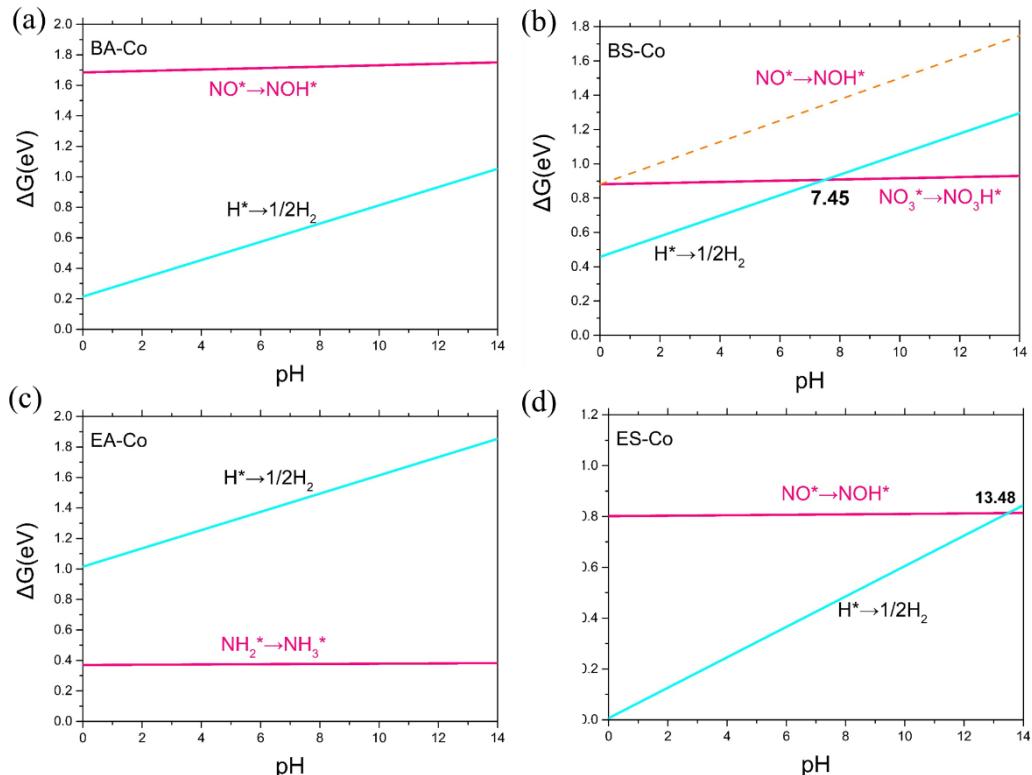

**Supplementary Figure 14.** The computed partial density of states (PDOS) and the crystal orbital Hamilton populations (COHPs) of  $\text{NH}_2^*$  in BS-TM (TM=Fe, Co, Ni, Mn). The bonding contribution of N and H in COHP are depicted by blue and orange, respectively.

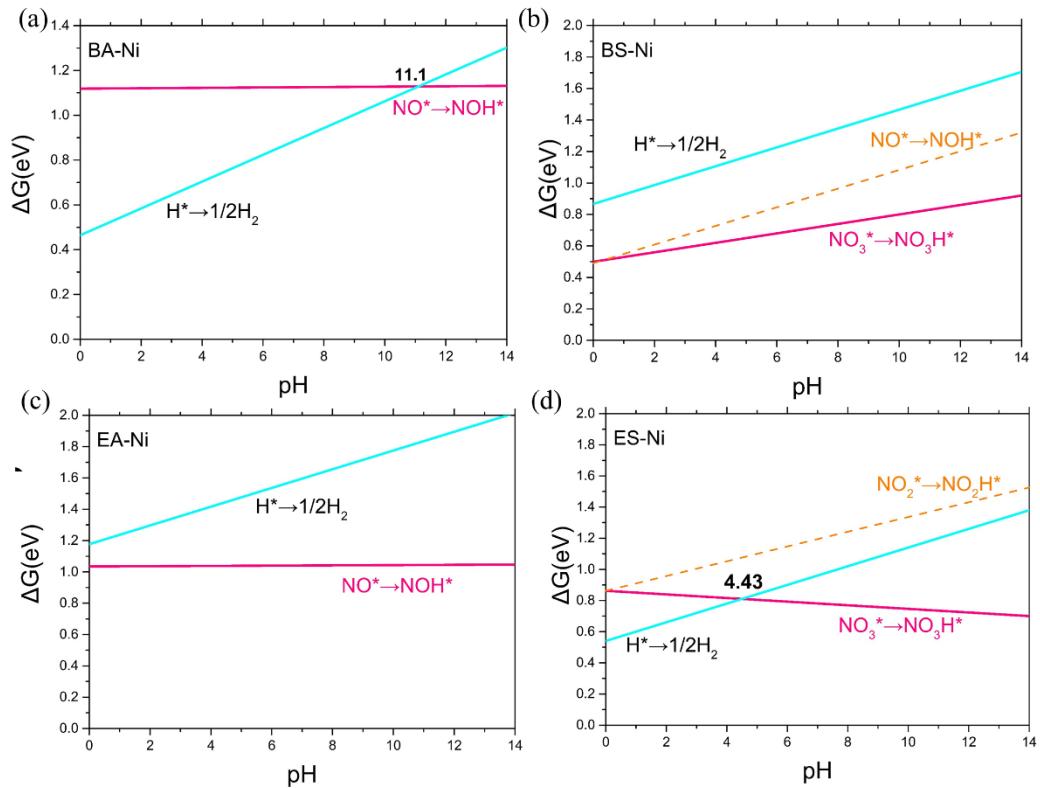

**Supplementary Figure 15.** The computed partial density of states (PDOS) and the crystal orbital Hamilton populations (COHPs) of  $\text{NH}_2^*$  in EA, BA, ES, BS-Co. The bonding contribution of N and H in COHP are depicted by red and green, respectively.

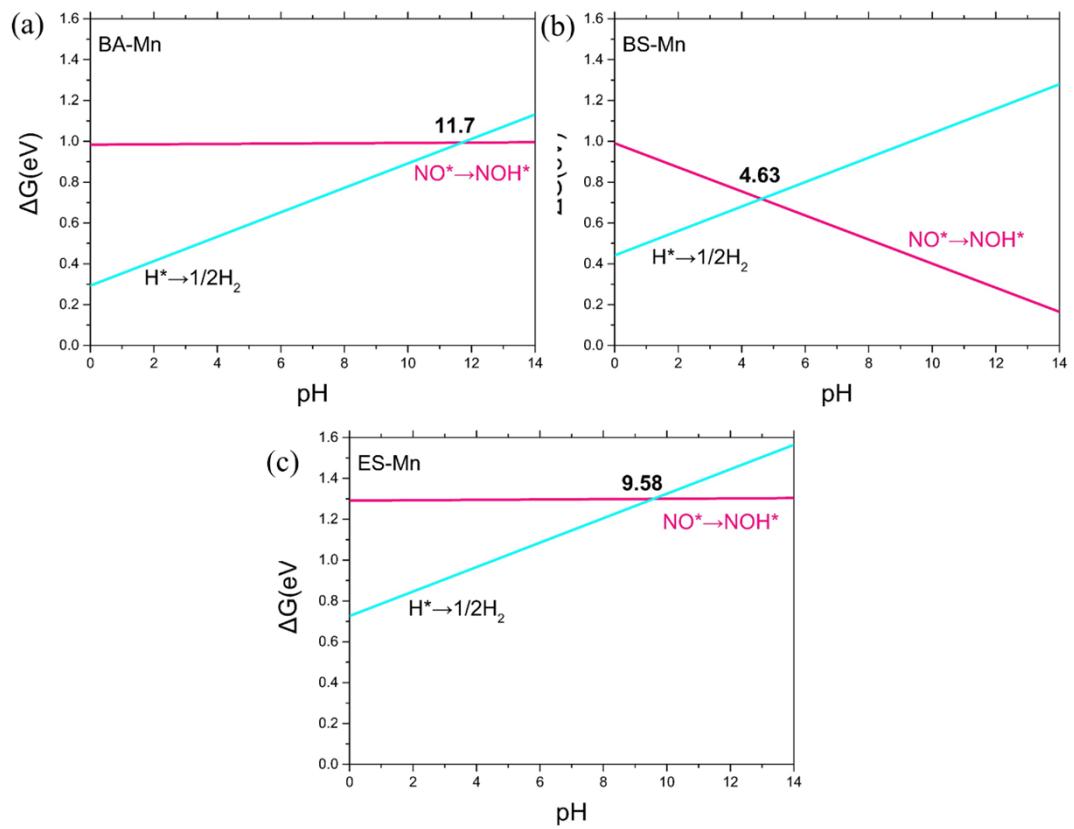

**Supplementary Figure 16.** Competing relationship between  $\text{NO}_3\text{RR}$  and HER on (a) BA-Fe, (b) BS-Fe, (c) EA-Fe and (d) ES-Fe.

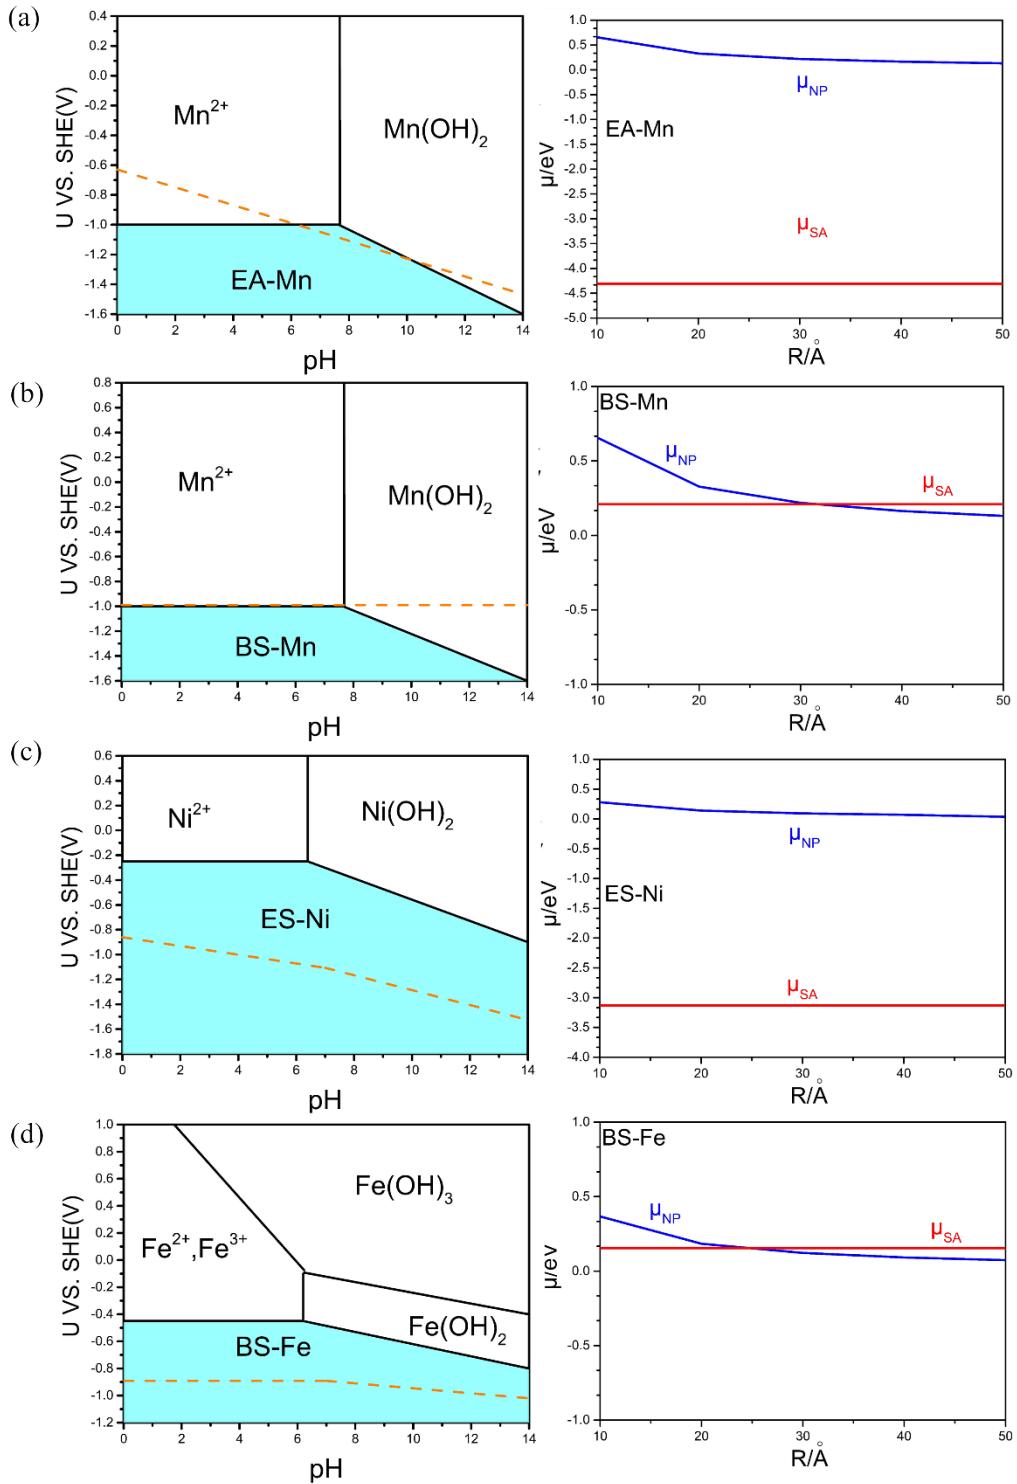

**Supplementary Figure 17.** Competing relationship between  $\text{NO}_3\text{RR}$  and HER on (a) BA-Co, (b) BS-Co, (c) EA-Co and (d) ES-Co.

**Supplementary Figure 18.** Competing relationship between  $\text{NO}_3\text{RR}$  and HER on (a) BA-Ni, (b) BS-Ni, (c) EA-Ni and (d) ES-Ni.

**Supplementary Figure 19.** Competing relationship between  $\text{NO}_3\text{-RR}$  and HER on (a) BA-Mn, (b) BS-Mn, and (c) ES-Mn.

**Supplementary Figure 20.** Pourbaix diagram for the electrochemical dissolution process of SA-MoS<sub>2</sub>, at 25°C. The orange dotted line represents the limiting potential of SA-MoS<sub>2</sub> at different pH. Comparison between chemical potential of NPs,  $\mu_{\text{NP}}(R)$ , and that of SAs,  $\mu_{\text{SA}}$ , with respect to curvature of NPs. Black line,  $\mu_{\text{NP}}(R)$ ; colored lines,  $\mu_{\text{SA}}$  of SA-MoS<sub>2</sub>.
