**Materials.** Bismuth nitrate ( $\text{Bi}(\text{NO}_3)_3 \cdot 5\text{H}_2\text{O}$ ) and copper nitrate ( $\text{Cu}(\text{NO}_3)_2 \cdot 3\text{H}_2\text{O}$ ) were purchased from Sigma-Aldrich Corporation (St. Louis, MO, USA). The Flap endonuclease 1 (FEN1) was obtained from PXN Biotechnology Co., Ltd. (Tianjin, China). The single-walled carbon nanotubes (SWCNT) were acquired from Nanotech Port Co., Ltd. (Shenzhen, China). Glioma samples were taken from Wuxi Hospital of Traditional Chinese Medicine (Wuxi, China). HeLa cells were purchased from the American Type Culture Collection (Manassas, USA). The FEN1 enzyme linked immunosorbent assay (ELISA) kits were supplied by Jianglai Biotechnology Co., Ltd. (Shanghai, China). Concentrated nitric acid ( $\text{HNO}_3$ ), ethylene glycol (EG), sodium hydroxide (NaOH), and hydrogen peroxide ( $\text{H}_2\text{O}_2$ , 30%) were all acquired from Sinopharm Chemical Reagent Co., Ltd. (Shanghai, China). The nucleoprotein extraction kits and all oligonucleotides (HPLC-purified) were purchased from Sangon Biotechnology Co., Ltd. (Shanghai, China), and the corresponding oligonucleotide sequences are provided in Table S1.

**Apparatus.** Scanning electron microscopy (SEM) images were obtained from a Hitachi S-4800

high resolution scanning electron microscope (Hitachi, Japan). The X-ray diffraction (XRD) pattern was observed with an X'Pert Philips materials research diffractometer (Bruker AXS, Germany). The X-ray photoelectron spectroscopy (XPS) was acquired from an Axis supra spectrometer (Kratos, UK). The Raman spectra were retrieved from an InVia Raman microscope spectrometer (Renishaw, UK). The photocurrent measurements, electrochemical impedance spectroscopy (EIS), and current–voltage (J–V) curves were conducted on a CHI 800C electrochemical workstation (Shanghai, China). The thermally stimulated current (TSC) assays were conducted on a Concept 40 broadband impedance spectrometer (Novocontrol, Germany). The photoluminescence (PL) spectra were performed on an FS5 fluorescence spectrometer (Edinburgh, UK). Fluorescence lifetimes were acquired from a Lifespec II time-resolved fluorescence lifetime spectrometer (Edinburgh, UK). The surface photovoltage (SPV) spectroscopy was obtained from a PL-SPS1000 surface photovoltage spectrometer (Zolix, China). The UV-vis diffuse reflectance spectra (UV-vis DRS) were acquired from an UV-vis-NIR-3600 spectrophotometer (Shimadzu, Japan). The atomic force microscopy (AFM) was conducted on a Multimode 8 atomic force microscope (Bruker, Germany). Transmission electron microscopy (TEM) images were acquired from a JEM-2100 Plus transmission electron microscope (Hitachi, Japan). The dynamic light scattering (DLS) assays were performed with a ZetaPALS analyzer (Bruker, USA). The circular dichroism (CD) experiments were conducted on a Chirascan V100 spectropolarimeter (Applied Photophysics Ltd., UK).

**Fig. S1** (A) SEM image and (B) XRD pattern of the as-prepared CuBi<sub>2</sub>O<sub>4</sub> nanopolyhedra.

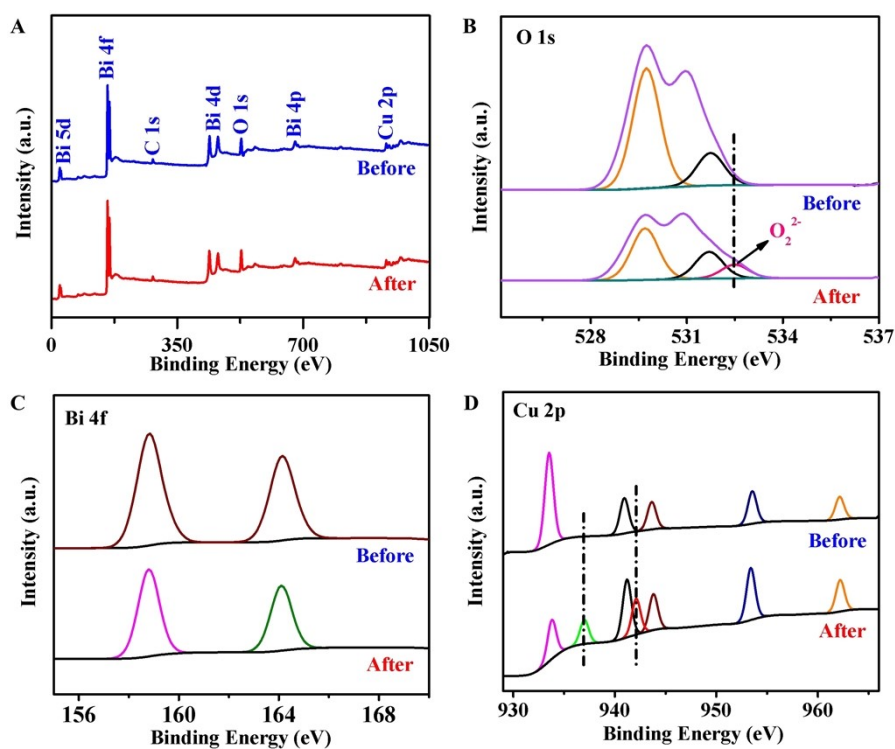

**Fig. S2** Influence of (A) excitation wavelength, (B) testing electrolyte pH, (C) applied potential, (D) amount of CuBi<sub>2</sub>O<sub>4</sub> dropped, and (E) reaction time on the PEC signal increment of the CuBi<sub>2</sub>O<sub>4</sub> modified electrode to H<sub>2</sub>O<sub>2</sub> (10 mM).

As illustrated in Fig. S2, we explored the effects of different conditions (including the light irradiation wavelength, PEC testing electrolyte pH, applied potential,  $\text{CuBi}_2\text{O}_4$  material dosage deposited, and the reaction time of  $\text{CuBi}_2\text{O}_4$  electrode with  $\text{H}_2\text{O}_2$ ) on the photocurrent responses of the  $\text{CuBi}_2\text{O}_4$  modified electrode to  $\text{H}_2\text{O}_2$ . And the corresponding optimal conditions were obtained as 460~470 nm, pH 7.4,  $-0.1$  V (vs. saturated Ag/AgCl), 1.0 mg/mL, and 60 s, respectively. Under the desired reaction conditions described above, the intensity of the photocurrents enhanced with the increase of  $\text{H}_2\text{O}_2$  concentrations (Fig. S3A), and the increment ( $\Delta I$ ) of the PEC signal was linear with the logarithm of the concentration of  $\text{H}_2\text{O}_2$  in the range of  $0.7 \mu\text{M}$ – $10$  mM (Fig. S3B). The detection limit was calculated to be  $0.23 \mu\text{M}$  ( $S/N=3$ ).

**Fig. S3** (A) Photocurrent responses of  $\text{CuBi}_2\text{O}_4$  modified ITO electrode to different concentrations of  $\text{H}_2\text{O}_2$  (the concentration of  $\text{H}_2\text{O}_2$  from left to right is 0, 0.0007, 0.001, 0.01, 0.1, 1.0, 3.0, and 10.0 mM, respectively). (B) The corresponding calibration curve.

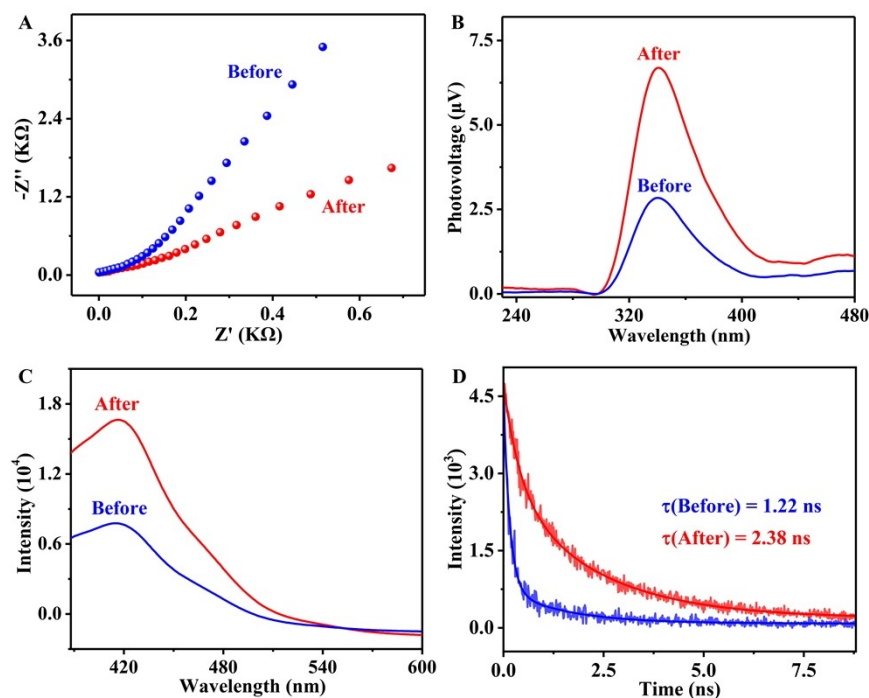

**Fig. S4** (A) XPS survey spectra of  $\text{CuBi}_2\text{O}_4$  before and after reaction with  $\text{H}_2\text{O}_2$ . High-resolution XPS spectra of (B) O 1s, (C) Bi 4f, and (D) Cu 2p.

**Fig. S5** (A) The Tauc plots of  $(\alpha h\nu)^2$  versus photon energy ( $h\nu$ ), and the LSV curve for measuring the (B) CB and (C) VB edges of  $\text{CuBi}_2\text{O}_4$  before and after reaction with  $\text{H}_2\text{O}_2$ .

**Fig. S6** (A) TSC spectra of  $\text{CuBi}_2\text{O}_4$  before and after reacted with  $\text{H}_2\text{O}_2$ . Test conditions for TSC: The polarization temperature is  $60\text{ }^\circ\text{C}$ , the polarization time is 10 min, and the applied field strength is 600 V/min. (B) J–V curves of  $\text{CuBi}_2\text{O}_4$  electrode before and after reacted with  $\text{H}_2\text{O}_2$  under illumination with LED light source in the 410~420 nm band.

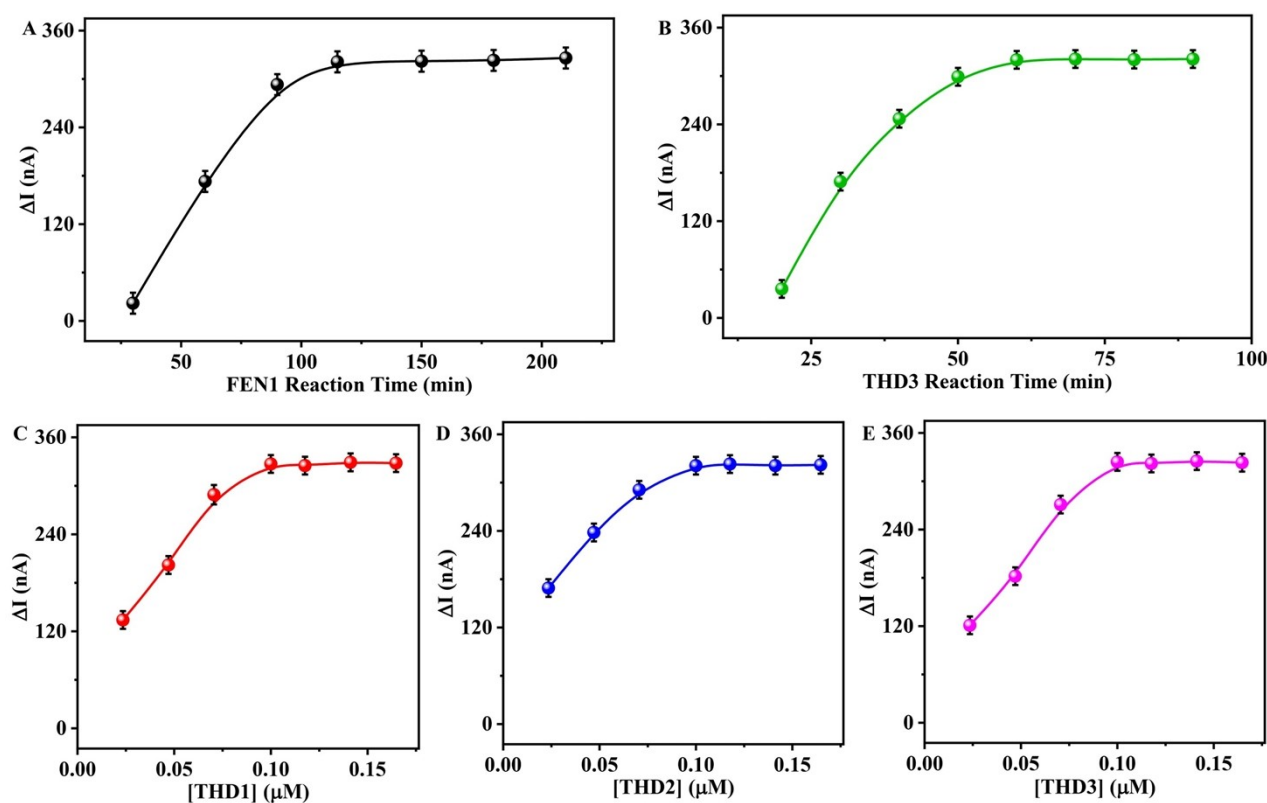

**Fig. S7** (A) Nyquist impedance plots, (B) SPV spectroscopy, (C) PL spectra, and (D) TRPL spectra of  $\text{CuBi}_2\text{O}_4$  before and after reacted with  $\text{H}_2\text{O}_2$ .

**Table S2.** Summary of the decay lifetimes of CuBi<sub>2</sub>O<sub>4</sub> before and after reaction with H<sub>2</sub>O<sub>2</sub>

Sample	A <sub>1</sub>	τ <sub>1</sub> (ns)	A <sub>2</sub>	τ <sub>2</sub> (ns)	χ <sup>2</sup>	τ <sub>avg</sub> (ns)
CuBi <sub>2</sub> O <sub>4</sub>	384.60	0.18	67.25	1.81	0.98	1.22
CuBi <sub>2</sub> O <sub>4</sub> /H <sub>2</sub> O <sub>2</sub>	194.75	0.49	260.31	2.64	0.99	2.38

Note: The fitting model is  $Y = A_1 e^{-\frac{X}{\tau_1}} + A_2 e^{-\frac{X}{\tau_2}}$ ,  $\tau_{\text{avg}} = \frac{A_1 \tau_1^2 + A_2 \tau_2^2}{A_1 \tau_1 + A_2 \tau_2}$ , where A<sub>1</sub> and A<sub>2</sub> indicate the decay constants, τ<sub>1</sub> and τ<sub>2</sub> represent decay times.

**Fig. S8** Optimization of (A) incubation time of FEN1, (B) reaction time for G-quadruplex formation by THD3 rich in G bases, the concentration of (C) THD1, (D) THD2, and (E) THD3 for PEC detection of FEN1.

As shown in Fig. S8, when the incubation time of FEN1 was 115 min, the reaction time for G-quadruplex formation by THD3 rich in G bases was 60 min, and the concentration of THD1, THD2, and THD3 were all at 0.1 μM respectively, the photocurrent intensity reached maxima, suggesting that the above results were ideal reaction conditions. Under optimal conditions, the PEC assay was executed for the quantitative analysis of FEN1.

**Table S3.** Comparison with other reported methods for the analysis of FEN1

Method	Material	Linear Range (pM)	LOD (fM)	Reference
RT-PCR	—	semiquantitative	—	1
Western blot	—	qualitative	—	2
Immunohistochemistry	—	qualitative	—	3
Fluorometry	GO	0.2–100.0	380.0	4
Fluorometry	—	0.001–10.0	0.5	5
Fluorometry	—	0.02–8.0	15.0	6
Photoelectrochemistry	CuBi <sub>2</sub> O <sub>4</sub>	0.001–100.0	0.3	This work

**Table S4.** Recovery assay of FEN1 by spiking into real samples extracted from glioma and HeLa cells

Sample	Content (pM)	Spiked (pM)	Found (pM)	Recovery (%)	RSD (n=5, %)
Glioma	2.8	1.0	3.9	110.0	1.7
		5.0	7.8	100.0	1.9
		10.0	13.1	103.0	2.1
HeLa cells	3.6	1.0	4.7	110.0	1.8
		5.0	8.7	102.0	2.0
		10.0	13.5	99.0	1.8

**Fig. S9** FEN1 analysis in glioma samples was performed exploiting our PEC method and ELISA method.

**Table S5.** The correlations between our PEC method and ELISA method for the quantification of FEN1 in glioma samples

Sample (#)	This Assay (pM)	ELISA Method (pM)	Relative Error (%)
1	6.47	6.38	+1.41
2	5.63	5.54	+1.62
3	5.02	5.11	-1.76
4	3.41	3.50	-2.57
5	2.87	2.81	+2.14
