1. General information

All the reactions were carried out in oven-dried reaction tubes. Reactions were monitored by thin-layer chromatography (TLC) using Merck silica gel 60 F₂₅₄ precoated plates (0.25 mm) and visualized by UV fluorescence quenching using an appropriate mixture of ethyl acetate and hexanes. Silica gel (particle size: 100-200 mesh) was purchased from Avra Synthesis Pvt. Ltd. and used for column chromatography using hexanes and ethyl acetate mixture as eluent. All the reactions were carried out in temperature-controlled IKA magnetic stirrers. ¹H and ¹³C NMR spectra were recorded on a Bruker 400 MHz and 500 MHz (100 MHz and 125 MHz for ¹³C) instrument. ¹H NMR spectra were reported relative to residual TMS (δ 0 ppm) and DMSO-d₆ (δ 2.50 ppm). ¹³C NMR spectral data were reported relative to CDCl₃ (δ 77.16 ppm) and DMSO-d₆ (δ 39.51 ppm). Chemical shifts were reported in parts per million and multiplicities are as indicated: s (singlet), d (doublet), t (triplet), q (quartet), p (pentet), m (multiplet), and br (broad). Coupling constants (*J*) are reported in Hertz. Melting points were recorded on a Guna capillary melting point apparatus and were corrected with benzoic acid as reference. Infrared spectra were recorded on an FTIR 4000 Series Spectrometer using a dry KBr pellet. The wavenumbers of recorded IR signals are quoted in cm⁻¹. High-resolution mass spectra (HRMS) were recorded on Q-Tof of a Micro mass spectrometer.

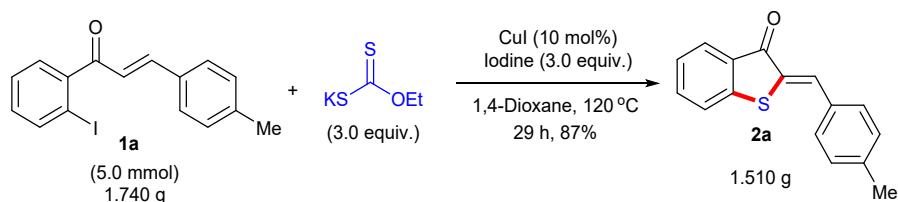

Solvents used for extraction and column chromatography were laboratory grade and used as received. Solvents for reactions were obtained from Fischer Scientific, India Pvt. Ltd. Various acetophenones were purchased from Alfa-esar, Sigma-Aldrich Company, Avra synthesis, and Spectrochem Pvt Ltd. CuI, and iodine was purchased from Avra. Potassium ethyl xanthogenate was obtained from Sigma-Aldrich and used directly as received.

2.0. General procedure for the synthesis of benzo[*b*]thiophen-3(2H)-one derivative.

Under open atmosphere, (*E*)-2-iodochalcone (1.0 mmol), potassium ethyl xanthate (3.0 mmol), Iodine (3.0 mmol), and CuI (0.1 mmol) were successively added to an oven-dried long reaction tube (reaction tube length = 20-30 cm). Then, 1,4-dioxane (4 mL) was added and closed with a glass stopper and sealed with teflon. After that, the reaction tube was immersed in a 120 °C pre-heated oil bath. Then the reaction was monitored by TLC. After completion of the reaction, the reaction mixture was brought to room temperature; saturated Na₂S₂O₃ solution was added and extracted with ethyl acetate (3×10 mL). Brine wash (1×20 mL) was given to the combined organic extractions and dried over anhydrous Na₂SO₄. Removal of solvent and silica gel column separation of the crude reaction mixture using hexanes and ethyl acetate mixture (90:10) afforded the corresponding (*Z*)-2-(4-methylbenzylidene)benzo[*b*]thiophen-3(2H)-one (2a): 92% yield (116 mg).

The same procedure was followed for the preparation of other benzo[*b*]thiophenone and thioindirubin 5.

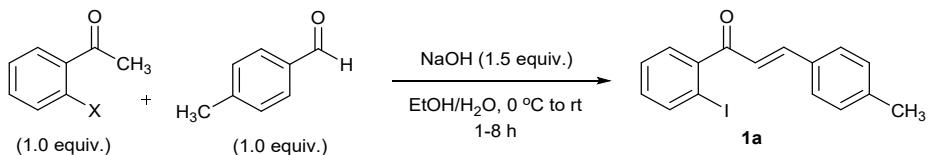

2.1. General procedure for the scale-up synthesis.

Under open atmosphere, (*E*)-2-iodochalcone (5.0 mmol), potassium ethyl xanthate (15.0 mmol), iodine (15.0 mmol), and CuI (0.5 mmol) were successively added to an oven-dried round bottom flask. Then, 1,4-dioxane (20 mL) was added and connected with a reflux condenser. The round bottom flask was then immersed in a 120 °C pre-heated oil bath. Then the reaction was monitored by TLC. After completion of the reaction, the reaction mixture was brought to room temperature; saturated Na₂S₂O₃ solution was added and extracted with ethyl acetate (3×50 mL). Brine wash (1×100 mL) was given to the combined organic extractions and dried over anhydrous Na₂SO₄. Removal of solvent and silica gel column separation of the crude reaction mixture using hexanes and ethyl acetate mixture (90:10) afforded the corresponding (*Z*)-2-(4-methylbenzylidene)benzo[*b*]thiophen-3(2*H*)-one (2a) in 87% yield (1.51 g).
