Electronic Supplementary Information

Experimental section

Materials: Ti_2O_3 (100 mesh, 99.9%) was purchased from Sigma-Aldrich. Hydrochloric acid (HCl, 36.0-38.0%), ammonium chloride (NH_4Cl, 99.5%), sodium hypochlorite (NaClO, AR), sodium hydroxide (NaOH, AR), salicylic acid ($C_7H_6O_3$, AR), sodium citrate dihydrate ($C_6H_5Na_3O_7·2H_2O$, AR), sodium nitroferricyanide (III) dihydrate ($Na_2Fe(CN)_5NO·2H_2O$, 99.0%), para-(dimethylamino) benzaldehyde ($C_9H_{11}NO$, 99.0%), and Nafion solution (5 wt%) were purchased from Aladdin Reagent Co., Ltd. Absolute ethanol (C_2H_5OH, 99.7%) and hydrazine hydrate ($N_2H_4·H_2O$, AR) were purchased from Beijing Chemical Corporation. Carbon paper was bought from Taiwan CeTech Company. The deionized water used throughout all experiments was purified by a Millipore system. All reagents were analytical reagent grade without further purification.

Preparation of OV-Ti_2O_3: Plasma treatment was performed on an AX-1000II plasma system with a radio frequency power generator (13.56 MHz) at room temperature. Ti_2O_3 particles were treated by Ar plasma for 300 s at a radiofrequency power of 600 W and a pressure of 20 Pa in Ar atmosphere (20 sccm) to obtain OV-Ti_2O_3.

Preparation of OV-Ti_2O_3/CP and pristine Ti_2O_3/CP: Typically, 10 mg of catalyst and 40 μL of the 5 wt% Nafion solution were dispersed in 720 μL of absolute ethanol and 240 μL of deionized water and ultrasonicated for 1 h to form a homogeneous ink.

Then 10 μL of ink was loaded onto a 1 cm^2 pretreated carbon paper (CP) and dried under infrared light for measurement.

Characterizations: X-ray powder diffraction (XRD) patterns were collected on a Shimadzu XRD-6100 diffractometer (Shimadzu, Japan) with a Cu Kα X-ray source. SEM images and corresponding EDX elemental mapping images were obtained from a GeminiSEM 300 field-emission scanning electron microscope (ZEISS, Germany) with an accelerating voltage of 5 kV. TEM and HRTEM images were performed on a Zeiss Libra 200FE transmission electron microscope at 200 kV. Raman spectra were obtained using a LabRAM HR Evolution Raman spectrometer. Electron paramagnetic resonance (EPR) measurements were conducted on a Bruker 500 spectrometer at 298 K. X-ray photoelectron spectroscopy (XPS) measurements were carried out on an ESCALAB 250Xi spectrometer equipped with monochromatized Al Kα radiation. Absorbance data were acquired on a Shimadzu UV-1800 UV-vis spectrophotometer. Ion chromatography (IC) data were obtained by using a ThermoFisher ICS 5000 plus IC. Gaseous products were detected by a Shimadzu GC-2014 gas chromatograph (GC) with thermal conductivity detector.

Electrochemical measurements: N_2 reduction experiments were carried out in a gastight H-type electrolytic cell separated by a Nafion 211 membrane under ambient conditions. The Nafion membrane was pretreated by heating in 3% H_2O_2 solution and 0.5 M H_2SO_4 at 80 °C for 1 h, respectively, and then immersed in deionized water for another 1 h. Electrochemical data were collected with a CHI760E electrochemical

workstation (Shanghai, Chenhua). In this work, OV-Ti$_2$O$_3$/CP, Ag/AgCl/saturated KCl, and graphite rod were used as the working electrode, reference electrode, and counter electrode, respectively. All potentials were converted to the reversible hydrogen electrode (RHE) through calibration (E (vs RHE) = E (vs Ag/AgCl) + 0.197 V + 0.059 × pH). Before NRR measurement, the HCl electrolyte was purged with N$_2$ for 30 min. For the NRR experiments, the chronoamperometry tests were performed in an N$_2$-saturated 0.1 M HCl solution (pH=1, 35 mL). During the electrolysis process, high-purity N$_2$ gas (99.999%) was continuously purged into the cathodic chamber at a flow rate of 20 mL min^{-1}.

Assembly of the Zn-N$_2$ battery and electrochemical test: The homemade rechargeable Zn-N$_2$ battery was assembled with OV-Ti$_2$O$_3$/CP (1 × 1 cm^2) electrode as the cathode and a polished Zn plate (1 × 1 cm^2) as the anode. A typical H-type cell containing 35 mL of cathode electrolyte (0.1 M HCl) and 35 mL of anode electrolyte (1 M KOH) is separated by a bipolar membrane (Nafion 211). N$_2$ gas was continuously bubbled into the catholyte during electrochemical testing. The discharge polarization curves with a scan rate of 2 mV s^{-1} and galvanostatic tests were performed on a CHI760E electrochemical workstation. The power density (P) of the Zn-N$_2$ battery was determined by $P = I \times V$, where I and V are the discharge current density and voltage, respectively.

The electrochemical reactions in Zn-N$_2$ battery are as follows:[1-3]

Cathode reaction: N$_2$ + 6H$_2$O + 6e$^-$ → 2NH$_3$ + 6OH$^-$
Anode reaction: $Zn + 2OH^- \rightarrow ZnO + H_2O + 2e^-$

Overall reaction: $3Zn + N_2 + 3H_2O \rightarrow 3ZnO + 2NH_3$

Determination of NH$_3$: The concentrations of NH_3 produced were detected by the indophenol blue method using a UV-vis spectrophotometer. Firstly, 2 mL of electrolyte was pipetted from the cathodic chamber and mixed with 2 mL of 1 M NaOH solution containing 5% $C_7H_6O_3$ and 5% $C_6H_5Na_3O_7 \cdot 2H_2O$. Then, 1 mL of 0.05 M NaClO and 0.2 mL of 1% $Na_2Fe(CN)_5NO \cdot 2H_2O$ were added to the above solution in turn. Finally, after standing for 120 min at room temperature, the absorbance measurements were performed in the range of 500 nm to 800 nm. The concentration-absorbance (at 655 nm) curves were calibrated by measuring a series of standard solutions with different NH_4Cl concentrations. The fitting curve of NH_3 (y = 0.3848x + 0.036, R^2 = 0.999) shows a good linear relationship between absorbance value and NH_4^+ concentration.

Determination of N$_2$H$_4$: The concentration of N_2H_4 was determined by Watt and Chrisp method. 5.99 g of p-$C_9H_{11}NO$, 30 mL of concentrated HCl, and 300 mL of C_2H_5OH were homogeneously mixed as a color reagent. Typically, 2 mL of electrolyte was removed from the cathodic chamber and mixed with 2 mL of the above-prepared color reagent. After standing for 10 min at room temperature, the UV-vis absorption spectra were collected at a wavelength of 455 nm. The fitting curve of N_2H_4 (y = 0.389x + 0.041, R^2 = 0.999) shows a good linear relationship between absorbance value with N_2H_4 concentration.

Calculations of NH₃ yield and Faradaic efficiency (FE):

NH₃ yield (V_{NH3}) was calculated using the following equation:

$$V_{NH3} = c(NH_3) \times V / (t \times m_{cat.}) \tag{1}$$

FE was calculated by the following equation:

$$FE_{NH3} = 3F \times c(NH_3) \times V / (17 \times Q) \times 100\% \tag{2}$$

where $c(NH_3)$ is the measured NH₃ concentration, V is the volume of the electrolyte in the cathodic chamber (35 mL), t is the electrolysis time (2 h), $m_{cat.}$ is the mass loading of the catalyst on CP (0.1 mg), F is the Faraday constant (96485 C mol⁻¹), and Q is the total charge passed through the electrode.

Calculation of FE for H₂:

FE for H₂ was calculated using the following equation:

$$FE_{H2} = 2F \times n(H_2) / Q \times 100\% \tag{3}$$

Calculations of electrochemical active surface area (ECSA) and turnover frequency (TOF): The ECSA of the electrode was determined by the electrochemical double-layer capacitance (C_{dl}). We tested the cyclic voltammetry curves of OV-Ti₂O₃ and pristine Ti₂O₃ at scanning rates of 20, 40, 60, 80, 100, 120, 140, and 160 mV s⁻¹ to calculate the C_{dl} value. Moreover, the specific capacitance (C_s) for a flat surface is generally found to be in the range of 20~60 μF cm⁻². The ECSA was calculated by dividing the C_{dl} with the specific capacitance ($C_s = 60$ μF cm⁻²) of flat electrodes in 0.1 M HCl.[4,5]

$$A_{ECSA} = C_{dl} / C_s \tag{4}$$

The TOF value of the electrocatalyst was calculated by the following equation:[6]

$$TOF = V_{NH3} \times m_{cat.} \times N_A / 17 \times \text{surface sites} \times A_{ECSA} \qquad (5)$$

where N_A is Avogadro constant (6.023×10^{23} mol^{-1}). Since the exact nitrogen binding site is unknown, we conservatively estimate the number of active sites as the total number of surface sites. Surface Ti ions of Ti_2O_3 are considered to be catalytic active species (two Ti atoms and three O atoms with a volume of 313.5 Å^3).

Surface sites per real surface area:[7,8]

$$\text{Surface sites} = \left(\frac{\text{Atoms per unit cell}}{\text{Volume/unit cell}} \right)^{\frac{2}{3}} = \left(\frac{5 \text{ Atoms/unit cell}}{313.5 \text{ Å}^3/\text{unit cell}} \right)^{\frac{2}{3}} \qquad (6)$$

Cathode: $12H_2O + 2N_2 + 12e^- \rightarrow 4NH_3 + 12OH^-$
Anode: $12OH^- \rightarrow 3O_2 + 6H_2O + 12e^-$
Total: $6H_2O + 2N_2 \rightarrow 4NH_3 + 3O_2$

Table S1. Comparison of the electrocatalytic NRR performances of $OV\text{-}Ti_2O_3$ with other reported Ti-based catalysts under ambient conditions.

Catalyst	Electrolyte	NH_3 yield	FE (%)	Ref.
$OV\text{-}Ti_2O_3$	0.1 M HCl	37.24 μg h^{-1} mg$_{cat.}^{-1}$	19.29	This work
Ti_2O_3	0.1 M HCl	26.01 μg h^{-1} mg$_{cat.}^{-1}$	9.16	9
$TiO_2(V_O)$	0.1 M HCl	3.0 μg h^{-1} mg$_{cat.}^{-1}$	6.5	10
$OV\text{-}TiO_2$ nanosheets	0.005 M H_2SO_4	35.6 μg h^{-1} mg$_{cat.}^{-1}$	5.3	11
$Ru/TiO_2\text{-}V_O$	0.1 M KOH	2.11 μg h^{-1} cm^{-2}	0.72	12
$Pd\text{-}Co/TiO_2\text{-}V_O$	0.1 M KOH	4.11 μg h^{-1} cm^{-2}	2.83	13
$Ag@TiO_2$	0.1 M Na_2SO_4	14.88 μg h^{-1} mg$_{cat.}^{-1}$	6.2	14
B-doped TiO_2	0.1 M Na_2SO_4	14.4 μg h^{-1} mg$_{cat.}^{-1}$	3.4	15
Mn-doped TiO_2	0.1 M Na_2SO_4	20.05 μg h^{-1} mg$_{cat.}^{-1}$	11.93	16
Pd-doped TiO_2	0.1 M Na_2SO_4	17.4 μg h^{-1} mg$_{cat.}^{-1}$	12.7	17
$TiO_2/JE\text{-}CMTs$	0.1 M Na_2SO_4	20.03 μg h^{-1} mg$_{cat.}^{-1}$	10.76	18
V-doped TiO_2	0.5 M $LiClO_4$	17.73 μg h^{-1} mg$_{cat.}^{-1}$	15.3	19
TiO_2/Ti	0.1 M Na_2SO_4	5.6 μg h^{-1} mg$_{cat.}^{-1}$	2.5	20
$Ti^{3+}\text{-}TiO_{2\text{-}x}/TM$	0.1 M Na_2SO_4	3.51×10^{-10} mol s^{-1} cm^{-2}	14.62	21
$d\text{-}TiO_2/TM$	0.1 M HCl	7.58 μg h^{-1} mg$_{cat.}^{-1}$	9.17	22
$C\text{-}Ti_xO_y/C$	0.1 M Li_2SO_4	14.8 μg h^{-1} mg$_{cat.}^{-1}$	17.8	23
TiC/C NF	0.1 M HCl	14.1 μg h^{-1} mg$_{cat.}^{-1}$	5.8	24
Zr-doped TiO_2	1.0 M KOH	8.9 μg h^{-1} cm^{-2}	17.3	25
La-doped TiO_2	0.1 M $LiClO_4$	23.06 μg h^{-1} mg$_{cat.}^{-1}$	14.54	26

Table S2. Comparison of NH$_3$ yield and power density of our battery with the reported Zn-N$_2$ battery systems.

Battery systems	Catalysts	Power density	NH$_3$ yield	Ref.
Zn-N$_2$	OV-Ti$_2$O$_3$	1.02 mW cm^{-2}	4.3 μg h^{-1} mg$_{cat.}^{-1}$	This work
Zn-N$_2$	CoPi/HSNPC	0.33 mW cm^{-2}	11.58 μg h^{-1} mg$_{cat.}^{-1}$	1
Zn-N$_2$	CoPi/NPCS	0.49 mW cm^{-2}	14.7 μg h^{-1} mg$_{cat.}^{-1}$	27
Zn-N$_2$	nano-Cu	0.0101 mW cm^{-2}	0.125 μg h^{-1} cm^{-2}	2
Zn-N$_2$	NbS$_2$ nanosheets	0.31 mW cm^{-2}	/	28
Zn-N$_2$	VN@NSC-900	0.01642 mW cm^{-2}	0.172 μg h^{-1} cm^{-2}	3
Zn-N$_2$	Fe$_{1.0}$HTNs	0.02765 mW cm^{-2}	0.137 μg h^{-1} cm^{-2}	29
Zn-N$_2$	Vs-FePS$_3$ NSs	2.6 mW cm^{-2}	/	30
