## 1. General Information

All reactions were carried out under an atmosphere of nitrogen in flame-dried sealed tube with magnetic stirring. **<sup>1</sup>H NMR** spectra, **<sup>13</sup>C {H} NMR** spectra, **<sup>19</sup>F NMR** spectra were recorded on a Bruker 400 MHz spectrometer in CDCl<sub>3</sub>. All signals are reported in  $\delta$  units, parts per million (ppm), and were referenced to CDCl<sub>3</sub> ( $\delta$  7.26 ppm for **<sup>1</sup>H NMR** and 77.0 ppm for **<sup>13</sup>C {H} NMR**) as the internal standard. Data for **<sup>1</sup>H NMR** spectra are reported as follows: chemical shift (ppm; s = singlet, d = doublet, t = triplet, dd = doublet of doublets, m = multiplet), coupling constant (Hz), and integration. Data for **<sup>13</sup>C {H} NMR** are reported in terms of chemical shift (ppm) relative to residual solvent peak (CDCl<sub>3</sub>: 77.0 ppm). HRMS spectra were recorded on GCQTOF 7200. MP data were recorded on WRS-2. Reactions were monitored by thin layer chromatography (TLC) using silica gel plates. Flash column chromatography was performed over silica gel (300-400 mesh ASTM, purchased from Yantai, China).

**Materials.** Unless otherwise noted, commercial reagents were purchased from Energy chemical, Bidepharm, Aesar, and other commercial suppliers and were used as received. Dioxane was freshly distilled from CaH<sub>2</sub>. THF was freshly distilled from sodium metal prior to use. Diazo esters were prepared according to the literature procedures.<sup>1-3</sup>

## 2. Detailed Optimization of Reaction Conditions

### 2.1 General

Under Ar atmosphere, to a 10 mL over-dried tube was charged with a stir bar and CoBr<sub>2</sub> (5 mol%, 3.3 mg). THF (1.5 mL) and aldehyde **1** (0.3 mmol, 1.0 equiv) was injected into the tube by syringe and stirred for 10 mins in the glovebox, then diazoester **2** (0.36 mmol, 1.2 equiv) was injected into the tube by syringe. The resultant solution was stirred at 80 °C for 24 hours (monitored by TLC). After the reaction is complete, the solution was concentrated under vacuum and the obtained residue was purified by flash column chromatography on silica gel (petroleum ether and ethyl acetate as eluents, the ratio is from 50:1 to 10:1) to afford epoxide **3**.

### 3.

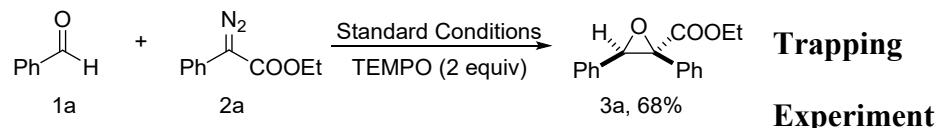

## Gram-scale Reaction

Under Ar atmosphere, to a 100 mL over-dried Schlenk tube was charged with a stir bar and  $\text{CoBr}_2$  (5 mol%, 55 mg). THF (30 mL) and benzaldehyde **1a** (0.53 g, 5 mmol,) was injected into the tube by syringe and stirred for 10 mins in the glovebox, then diazoester **2a** (1.14 g, 6 mmol,) was injected into the tube by syringe. The resultant solution was stirred at 80  $^\circ\text{C}$  for 24 hours (monitored by TLC). After the reaction is complete, the solution was concentrated under vacuum and the obtained residue was purified by flash column chromatography on silica gel (petroleum ether and ethyl acetate as eluents, the ratio is 50:1) to afford oxirane **3a** (1.16 g, 86%).

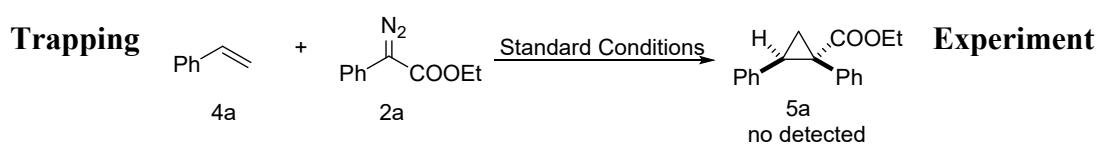

## 4. Control Experiments
