2. The calculated condensed Fukui function

To further study the local reactivity and regioselectivity for the Cu-catalyzed [3+3]-cycloaddition, the condensed Fukui function (f^+ and f^- in Table S1) were calculated by Multiwfn 3.8 for enoldiazoacetate and carbonyl ylide to predict the active site. The f^+ and f^- functions are used to identify the favorable reactive sites for nucleophilic and electrophilic attack respectively. For the enoldiazoacetate, the more electrophilic center corresponds with the carbon atom C1, with $f^- = 0.207$,

while the more nucleophilic center corresponds with the C3, with $f^{\ddagger}=0.077$. For the carbonyl ylide, the C4 and C5 atoms are the electrophilic and nucleophilic centers respectively. As a consequence, the more favorable polar interaction should take place between C1 and C5 atoms, which is apparently in contrast to the experimental results. This inconsistency may arise from the steric effects caused by the TIPS group.

Table S1. The calculated condensed Fukui function for enoldiazoacetate and carbonyl ylide.

| | <i>enoldiazoacetate</i> | <i>carbonyl ylide</i> | | | |
|----------------|-------------------------|-----------------------|-------|-------|-------|
