## SYMBOLS and ABBREVIATIONS

<b>1</b>	phenol
<b>2</b>	4-OH-acetophenone
<b>3</b>	C-methylcalix[4]resorcinarene
<b>4</b>	C-undecylcalix[4]resorcinarene
<b>5</b>	baicalein
AcOH	acetic acid
MeOH	methanol

## Experimental

Commercially available phenols **1**, **2** and **5** were of the highest purity and were used as received. Macroyclic polyphenols: C-methylcalix[4]resorcinarene (**3**) and C-undecylcalix[4]resorcinarene (**4**) were prepared following the method proposed by Weinelt and Schneider<sup>1</sup> by condensation of resorcinol and appropriate aldehyde in ethanol containing aqueous HCl as in our previous work.<sup>2</sup> <sup>1</sup>H NMR of C-alkyl[4]resorcinarenes were recorded on a Varian spectrometer at 300 MHz and 298K and were compared with literature.<sup>3</sup>

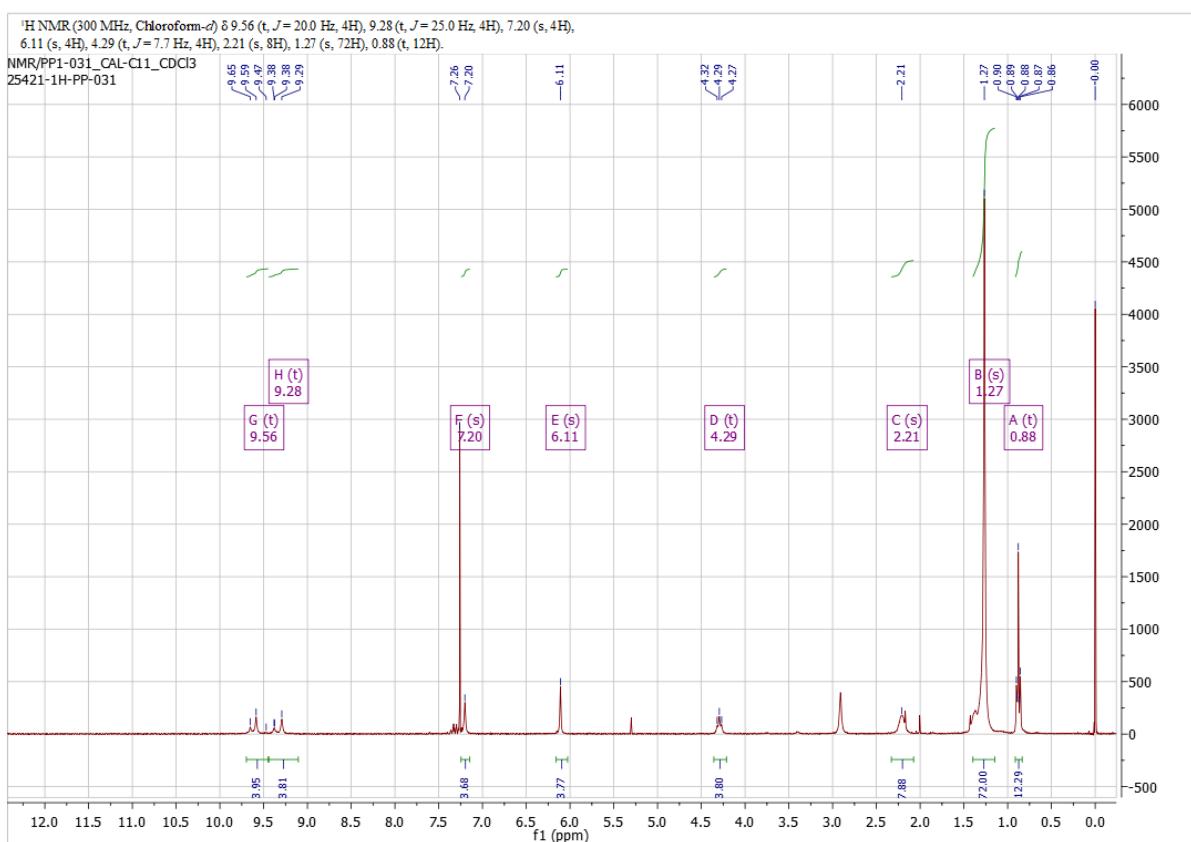

**3** was obtained by condensation of resorcinol with ethanal. 0.5 mol of resorcinol dissolved in 500 mL of ethanol /water (1/1, v/v) was immersed in an ice bath, then 125 mL of concentrated hydrochloric acid was added. After that, 0.5 mol of ethanal was added dropwise. Then, temperature was allowed to cool down to rt, and the reaction was carried out during 96 hours with continuous stirring under nitrogen. The mixture was cooled and concentrated under reduced pressure. The obtained precipitate was washed several times with cold ethanol, crystallized from ethanol/ water (1:1), and dried (yield 40-50%). <sup>1</sup>H NMR (300 MHz, Acetone-*d*<sub>6</sub>) δ 8.48 (s, 8H), 7.64 (s, 4H), 6.21 (s, 4H), 4.52 (q, *J* = 7.3 Hz, 4H), 1.76 (d, *J* = 7.4 Hz, 12H). Signals at 2.95 ppm comes from water<sup>2, 3b, 4</sup> and 2.09 ppm from traces of aldehyde (substrate), see Fig. S1.

**4** was obtained by condensation of resorcinol (0.69 mol) with dodecanal (0.69 mol). Compounds were dissolved in 690 mL of ethanol and cooled in the ice bath to temperature close to 0 °C. After that 111 mL of concentrated hydrochloric acid was added dropwise to the mixture. Then, the temperature was increased to 70 °C, and kept during 12 hours with continuous stirring and nitrogen flow. The mixture was cooled and concentrated under reduced pressure. The obtained precipitate was washed several times with cold ethanol, crystallized from methanol and dried (yield 20-30%). <sup>1</sup>H NMR (300 MHz, CDCl<sub>3</sub>) δ 9.56 (t, *J* = 20.0 Hz, 4H), 9.28 (t, *J* = 25.0 Hz, 4H), 7.20 (s, 4H), 6.11 (s, 4H), 4.29 (t, *J* = 7.7 Hz, 4H), 2.21 (s, 8H), 1.27 (s, 72H), 0.88 (t, 12H). Signal at 2.95 ppm is from traces of persistently present water, in agreement with several reports<sup>2, 3b, 4</sup>, see Fig. S2.

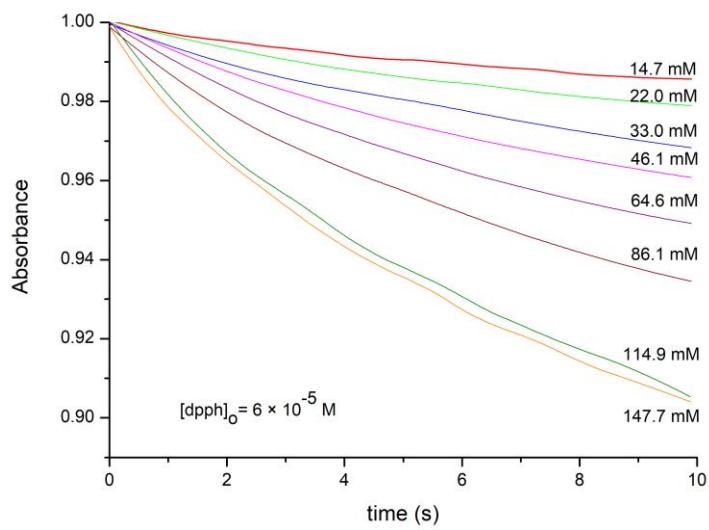

Since rate of ArOH/dpph<sup>•</sup> reaction in neat methanol is highly sensitive to traces of acids and bases, prior to the use methanol was fractionally distilled over a small amount of dpph<sup>•</sup> and a few beads of an acidic ion-exchange resin. The measurements were made following the procedure described previously.<sup>5</sup> Decays of dpph<sup>•</sup> ( $\epsilon \sim 11\,000\text{ M}^{-1}\text{cm}^{-1}$ , initial concentrations  $6\text{--}12 \times 10^{-5}\text{ M}$  for **1** and **2** and  $1\text{--}15 \times 10^{-5}\text{ M}$  for much more reactive **3**-**5**) in the presence of a stoichiometric excess of the phenol were monitored 517 nm on an Applied Photophysics SX 20 stopped flow spectrometer, equipped with a xenon arc lamp source and photodiode array detector. Mixing cell (10 mm optical path length, dead-time of mixing 1.1 ms) and the tubes delivering the reactants were thermostated at temp. 25°C. Measurements were conducted in neat and acidified methanol (with 10, 100, and 1000 mM AcOH) and in mixed 1:1 (v/v) methanol-water with pH adjusted to 5.4 (acetate buffer), and pH 7.4 (phosphate buffer). The initial rates of reaction (usually 5-10% of dpph<sup>•</sup> conversion, see footnote 9) were monitored giving the pseudo-first-order rate constants, *k*<sub>exp</sub>, calculated as average values from at least two independent sets of measurements. Values of bimolecular rate constants, *k*<sup>S</sup> were calculated as a slope of the straight-line equation 3. EPR measurements by Staško et al.<sup>6</sup> for mixed ethanol/water systems indicated that dpph<sup>•</sup> behaves as typical solute for lower water ratio 0-60% (v/v) but at higher water content (above 60%) dpph<sup>•</sup> forms microaggregates (still without precipitation). We assume dpph<sup>•</sup> forms a homogeneous system with water /methanol (1:1, v/v).

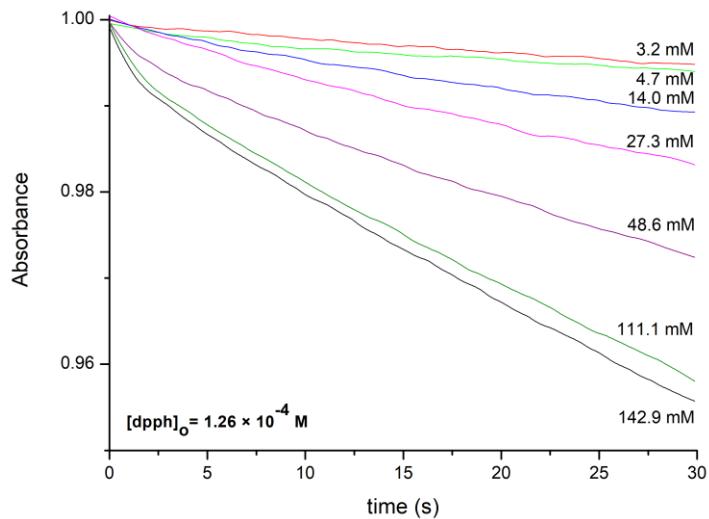

**Figure S1.** <sup>1</sup>H NMR spectrum of **3** recrystallized from ethanol/water (1/1).

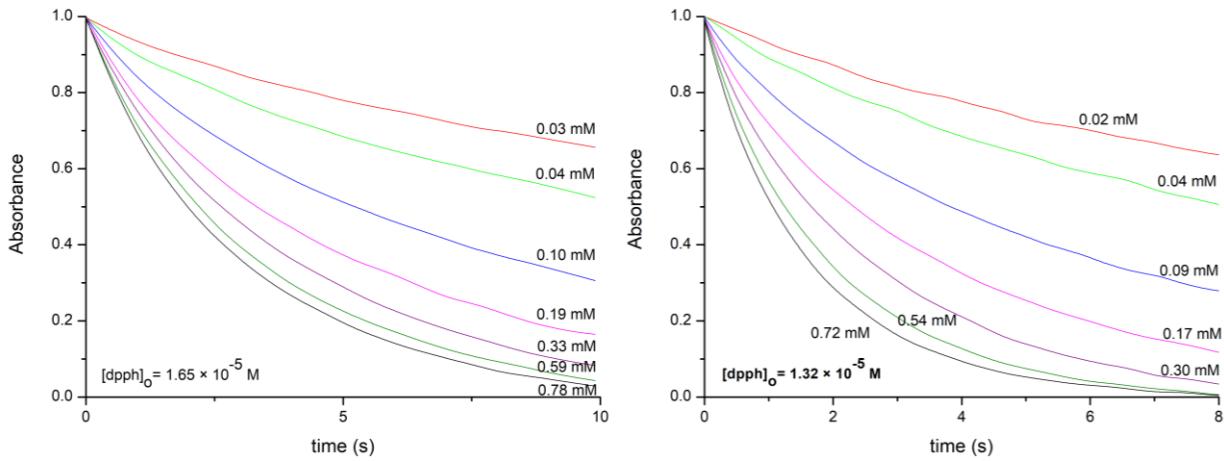

**Figure S2.** <sup>1</sup>H NMR spectrum of **4** recrystallized from methanol

### Summary of the results for **2** in methanol:

#### lower concentrations:

$$k^{\text{MeOH}} = (4.4 \pm 0.7) \times 10^{-3} \text{ M}^{-1}\text{s}^{-1}$$

$$k^{\text{MeOH}/10\text{mM AcOH}} = (4.0 \pm 1.2) \times 10^{-3} \text{ M}^{-1}\text{s}^{-1}$$

$$k^{\text{MeOH}/100\text{mM AcOH}} = (4.5 \pm 2.2) \times 10^{-3} \text{ M}^{-1}\text{s}^{-1}$$

$$k^{\text{MeOH}/1000\text{mM AcOH}} = (4.8 \pm 3.4) \times 10^{-3} \text{ M}^{-1}\text{s}^{-1}$$

#### higher concentrations

$$k^{\text{MeOH}} = (16.1 \pm 2.8) \times 10^{-3} \text{ M}^{-1}\text{s}^{-1}$$

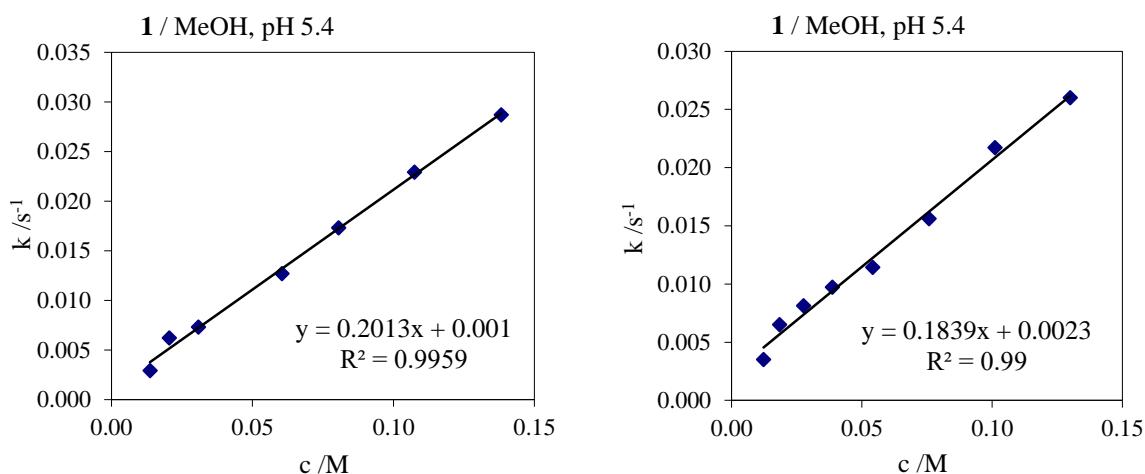

$$k^{\text{MeOH}/10\text{mM AcOH}} = (11.2 \pm 0.1) \times 10^{-3} \text{ M}^{-1}\text{s}^{-1}$$

$$k^{\text{MeOH}/100\text{mM AcOH}} = (11.6 \pm 2.1) \times 10^{-3} \text{ M}^{-1}\text{s}^{-1}$$

$$k^{\text{MeOH}/1000\text{mM AcOH}} = (17.2 \pm 2.8) \times 10^{-3} \text{ M}^{-1}\text{s}^{-1}$$

**Table S9.** Kinetic data for the reaction of **dpph<sup>•</sup>** with **1** in 1:1 MeOH/water at pH= 5.4. Symbols and abbreviations are the same as in caption to Table S1.

**Figure S39.** Dissociation diagrams of **1** (upper panel) and **2** (lower panel) within the pH range 4–14 (in water) calculated with  $\text{p}K_{\text{a}}$  values listed in Table 1 of the main manuscript. Solid line – neutral form,  $\text{ArOH}$ ; dashed line – monoanion,  $\text{ArO}^-$ .

**Figure S40.** Dissociation diagrams of **3** (upper panel) and **5** (lower panel) within the pH range 4–14 (in water) calculated with pK<sub>a</sub> values listed in Table 1 of the main manuscript. Solid line – neutral form, Ar(OH)<sub>3</sub>; dashed line – monoanion, Ar(OH)<sub>2</sub>O<sup>-</sup>; dotted-dashed line – dianion, Ar(OH)O<sup>2-</sup>; dotted line - trianion, ArO<sup>3-</sup>, respectively (three-step dissociation was calculated for both compounds).

## Estimation of the rate constants for electron transfer from phenolate anions to dpph<sup>•</sup>.

The rate law for the reaction:

carried out in pseudo first-order conditions (excess of [ArOH] over [dpph<sup>•</sup>]) is:

$$-\frac{d[\text{dpph}^{\bullet}]}{dt} = n k^S [\text{ArOH}] [\text{dpph}^{\bullet}] = n k_{\text{exp}} [\text{dpph}^{\bullet}] \quad (\text{S2})$$

The rates for two different concentrations [ArOH]<sub>1</sub> and [ArOH]<sub>2</sub> can be compared:

$$\frac{R_1}{R_2} = \frac{(-d[\text{dpph}^{\bullet}]/dt)_1}{(-d[\text{dpph}^{\bullet}]/dt)_2} = \frac{n k_{\text{exp1}} [\text{dpph}^{\bullet}]}{n k_{\text{exp2}} [\text{dpph}^{\bullet}]} \approx \frac{k_{\text{exp1}}}{k_{\text{exp2}}} \quad (\text{S3})$$

The rate law for the overall process is a sum of two processes, HAT and ET:

$$R = -\frac{d[\text{dpph}^{\bullet}]}{dt} = n(k^{\text{HAT}} [\text{ArOH}] + k^{\text{ET}} [\text{ArO}^-]) [\text{dpph}^{\bullet}] \quad (\text{S4})$$

combination of S3 and S4 gives:

$$\frac{k_{\text{exp1}}}{k_{\text{exp2}}} \approx \frac{n(k^{\text{HAT}} [\text{ArOH}]_1 + k^{\text{ET}} [\text{ArO}^-]_1) [\text{dpph}^{\bullet}]}{n(k^{\text{HAT}} [\text{ArOH}]_2 + k^{\text{ET}} [\text{ArO}^-]_2) [\text{dpph}^{\bullet}]} = \frac{k^{\text{HAT}} [\text{ArOH}]_1 + k^{\text{ET}} [\text{ArO}^-]_1}{k^{\text{HAT}} [\text{ArOH}]_2 + k^{\text{ET}} [\text{ArO}^-]_2} \quad (\text{S5})$$

For very small degree of dissociation: [ArOH]-[ArO<sup>-</sup>]≈[ArOH], and substituting

$$[\text{ArO}^-]_1 = \sqrt{K_a [\text{ArOH}]_1} \text{ and } [\text{ArO}^-]_2 = \sqrt{K_a [\text{ArOH}]_2} :$$

$$\frac{k_{\text{exp1}}}{k_{\text{exp2}}} = \frac{k^{\text{HAT}} [\text{ArOH}]_1 + k^{\text{ET}} \sqrt{K_a [\text{ArOH}]_1}}{k^{\text{HAT}} [\text{ArOH}]_2 + k^{\text{ET}} \sqrt{K_a [\text{ArOH}]_2}} \quad (\text{S6})$$

$$k_{\text{exp1}} k^{\text{HAT}} [\text{ArOH}]_2 + k_{\text{exp1}} k^{\text{ET}} \sqrt{K_a [\text{ArOH}]_2} = k_{\text{exp2}} k^{\text{HAT}} [\text{ArOH}]_1 + k_{\text{exp2}} k^{\text{ET}} \sqrt{K_a [\text{ArOH}]_1} \quad (\text{S7})$$

$$k_{\text{exp1}} k^{\text{HAT}} [\text{ArOH}]_2 - k_{\text{exp2}} k^{\text{HAT}} [\text{ArOH}]_1 = k_{\text{exp2}} k^{\text{ET}} \sqrt{K_a [\text{ArOH}]_1} - k_{\text{exp1}} k^{\text{ET}} \sqrt{K_a [\text{ArOH}]_2} \quad (\text{S8})$$

$$k^{\text{HAT}} (k_{\text{exp1}} [\text{ArOH}]_2 - k_{\text{exp2}} [\text{ArOH}]_1) = k^{\text{ET}} \sqrt{K_a} (k_{\text{exp2}} \sqrt{[\text{ArOH}]_1} - k_{\text{exp1}} \sqrt{[\text{ArOH}]_2}) \quad (\text{S9})$$

$$\frac{k^{\text{ET}}}{k^{\text{HAT}}} = \frac{(k_{\text{exp1}} [\text{ArOH}]_2 - k_{\text{exp2}} [\text{ArOH}]_1)}{\sqrt{K_a} (k_{\text{exp2}} \sqrt{[\text{ArOH}]_1} - k_{\text{exp1}} \sqrt{[\text{ArOH}]_2})} \quad (\text{S10})$$

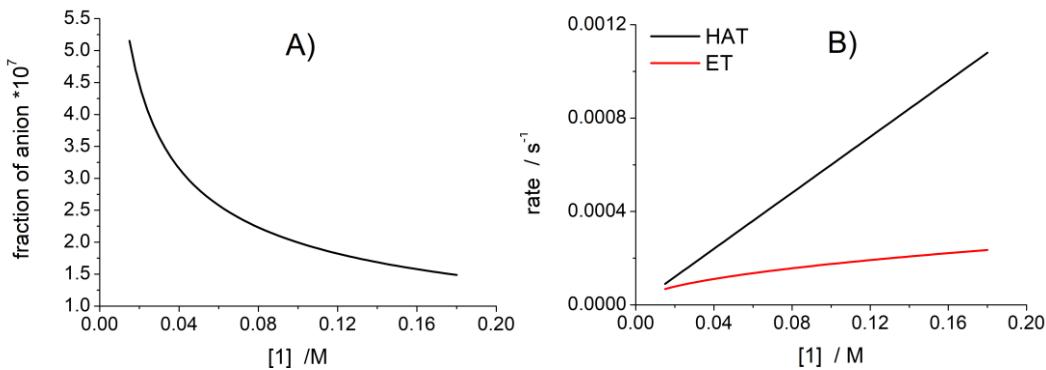

Comments:

- a) the above proportion is approximate, non-analytical comparison of two processes which exhibit different orders in [ArOH],
- b) for very diluted solution of ArOH the errors of measurements of  $k_{\text{exp}}$  (regardless their origin, like accuracy of signal detection or presence of traces of acids/bases in a solvent) might result in large errors in final  $k^{\text{ET}}/k^{\text{HAT}}$ .

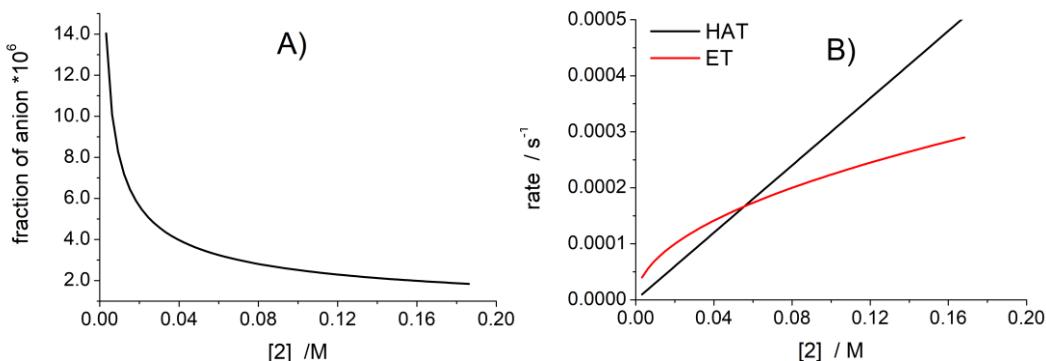

**Table S25.** Parameters used for estimation of  $k^{\text{ET}}/k^{\text{HAT}}$  ratio.

phenol	1	2	3	5	quercetin <sup>a</sup>
pK <sub>a</sub> (MeOH)	14.4	12.2	13.5	9.5	12.8
[ArOH] <sub>1</sub> /M	0.150	0.0486	1.9×10 <sup>-4</sup>	4.4×10 <sup>-4</sup>	5.8×10 <sup>-4</sup>
