## Experimental Procedures

## Section S1. Materials and Methods

### 1.1 Materials and reagents.

The raw materials were purchased from Aladdin and used without further purification. All syntheses were carried out in 15 mL Teflon-lined reaction vessel under autogenous pressure.

### 1.2 X-ray crystallography

SCXRD measurements were performed using a Rigaku XtaLAB Pro diffractometer with $\mathrm{Cu}-\mathrm{K} \alpha$ radiation $(\lambda=1.54184$ $\AA$ ) for $\mathbf{A g}_{14}$ and $\mathbf{A g}_{24}-\mathbf{C}_{2} \mathbf{F}_{5}$, as well as Mo-K $\alpha$ radiation $\left(\lambda=0.71073 \AA\right.$ ) for $\mathbf{A g}_{24}$. Data collection and reduction were performed using CrysAlis ${ }^{\text {Pro }}$. The structures were solved using intrinsic phasing methods (SHELXT-2015) ${ }^{1}$ and refined by full-matrix least squares on $F^{2}$ using OLEX2, ${ }^{2}$ which utilizes the SHELXL-2018/3 module. ${ }^{3}$

All hydrogen atoms were placed in their calculated positions with idealized geometries, and they possessed fixed isotropic displacement parameters. Appropriate restraints and/or constraints were applied to the geometry, and the atomic displacement parameters of the atoms in the cluster were determined. All non-H atoms were located in the electron density and refined with anisotropic thermal parameters. Due to disorder of the $\mathrm{CF}_{3} \mathrm{COO}^{-}$, FLAT restraints were applied to keep the planarity of F atoms; SADI and DFIX were applied to keep the distances of $\mathrm{C}-\mathrm{F}(c a .1 .45 \AA), \mathrm{C}-\mathrm{C}(c a .1 .53 \AA)$ and $\mathrm{F} \cdots \mathrm{F}$ of the $\mathrm{CF}_{3} \mathrm{COO}^{-}$in reasonable range; SAME restraints were applied to keep similar configurations of $\mathrm{CF}_{3} \mathrm{COO}^{-}$ ligands. Besides, DFIX restraints were applied to keep the distances of $\mathrm{C}=\mathrm{O}(c a .1 .2 \AA)$, and $\mathrm{C}-\mathrm{N}(c a .1 .45 \AA)$ of the DMF molecules in a reasonable range. ISOR, DELU and SIMU restraints were used for some atoms, especially peripheral F atoms with large thermal motion. All structures were examined using the Addsym subroutine of PLATON to ensure that no additional symmetry could be applied to the models. ${ }^{4}$ A solvent mask has been used due to severe disorder of free solvent and $\left[\mathrm{NH}_{2}\left(\mathrm{CH}_{3}\right)_{2}\right]^{+}$molecules around the cluster and diffract weakly.

Detailed information with respect to the X-ray crystal data, intensity collection procedure, and refinement results for the entire cluster compounds are summarized in Tables S1-S3.

### 1.3 Characterization.

UV-Vis absorption spectra (liquid) were recorded on a U-2000 spectrophotometer.
ESI-MS spectra were obtained on a SCIEX X500R QTOF LC/MS spectrometer.

### 1.4 Density functional theory (DFT) and time dependent density functional theory (TD-DFT) calculation.

Density functional theory (DFT) and time-dependent density functional theory (TD-DFT) calculations were performed using Gaussian $16^{5}$ software with Perdew-Burke-Ernzerhof (PBE) functional. ${ }^{6}$ All calculations were conducted using the Def2SVP basis set for H, C, O, N, F, S and Ag atoms. ${ }^{7}$ The single crystal structure was chosen as an initial guess for ground-state optimization, and all reported stationary points were verified as true minima by the absence of negative eigenvalues in the vibrational frequency analysis. The calculated absorption spectra were obtained using Multiwfn 3.7 (dev). ${ }^{8}$

## Section S2. Synthesis

## Synthesis of $\mathbf{A g}_{24}\left(\mathbf{A g}_{24} \mathbf{S}\left(\mathbf{S}^{i} \mathbf{P r}\right)_{\mathbf{8}}\left(\mathbf{C F}_{3} \mathbf{C O O}\right)_{10}(\mathrm{DMF})_{\mathbf{8}} \cdot \mathbf{2}\left(\mathbf{N H}_{\mathbf{2}}\left(\mathbf{C H}_{3}\right)_{\mathbf{2}} \mathbf{C F}_{\mathbf{3}} \mathbf{C O O}\right)\right.$

$\left\{\mathrm{Ag}\left(\mathrm{S}^{i} \mathrm{Pr}\right)\right\}_{n}(0.05 \mathrm{mmol}, 9 \mathrm{mg})$ and $\mathrm{CF}_{3} \mathrm{COOAg}_{(0.10 \mathrm{mmol}, 22.1 \mathrm{mg})}$ were dissolved together in a mixed solvent of ${ }^{i} \mathrm{PrOH}$ and DMF ( $4.0 \mathrm{~mL}, v: v=3: 1$ ), and then, $50 \mu \mathrm{~L}$ of $\mathrm{CF}_{3} \mathrm{COOH}$ was added to the above solution. The mixture was sealed in a $15-\mathrm{mL}$ Teflon-lined reaction vessel and kept at $80^{\circ} \mathrm{C}$ for 3 h . After cooling to room temperature, the yellow solution was filtered and evaporated in the dark for 1 week. Yellow block crystals of $\mathbf{A g}_{24}$ were isolated and washed with dichloride/nhexane at a yield of $20 \%$ (based on $\left\{\mathrm{Ag}\left(\mathrm{S}^{i} \mathrm{Pr}\right)\right\}_{n}$ ). Elemental analysis (found (calcd), \%; based on $\mathrm{C}_{68} \mathrm{H}_{112} \mathrm{Ag}_{24} \mathrm{~F}_{30} \mathrm{~N}_{8} \mathrm{O}_{28} \mathrm{~S}_{9}$ ): C, 17.46 (17.37); H, 2.39 (2.45); N, 2.72 (2.66); S, 5.31 (5.49).

## 

$\left\{\mathrm{Ag}\left(\mathrm{S}^{i} \mathrm{Pr}\right)\right\}_{n}(0.05 \mathrm{mmol}, 9 \mathrm{mg})$ and $\mathrm{C}_{2} \mathrm{~F}_{5} \mathrm{COOAg}(0.10 \mathrm{mmol}, 27 \mathrm{mg})$ were dissolved together in a mixed solvent of ${ }^{i} \operatorname{PrOH}$ and DMF ( $4.0 \mathrm{~mL}, v: v=3: 1$ ), and then, $50 \mu \mathrm{~L}$ of $\mathrm{C}_{2} \mathrm{~F}_{5} \mathrm{COOH}$ was added to the above solution. The mixture was sealed in a $15-\mathrm{mL}$ Teflon-lined reaction vessel and kept at $80^{\circ} \mathrm{C}$ for 3 h . After cooling to room temperature, the yellow solution was filtered and evaporated in the dark for 1 week. Yellow block crystals of $\mathbf{A g}_{24}-\mathbf{C}_{2} \mathbf{F}_{5}$ were isolated and washed with dichloride $/ n$-hexane at a yield of $25 \%$ (based on $\left\{\operatorname{Ag}\left(\mathrm{S}^{i} \operatorname{Pr}\right)\right\}_{n}$ ). Elemental analysis (found (calcd), \%; based on $\mathrm{C}_{79} \mathrm{H}_{107} \mathrm{Ag}_{24} \mathrm{~F}_{60} \mathrm{~N}_{7} \mathrm{O}_{29} \mathrm{~S}_{9}$ ): C, 17.86 (18.05); H, 1.92 (2.20); N, 2.26 (2.39); S, 4.75 (4.93).

### 2.1. Different reaction time

$\left\{\operatorname{Ag}\left(\mathrm{S}^{i} \mathrm{Pr}\right)\right\}_{n}(0.05 \mathrm{mmol}, 9 \mathrm{mg})$ and $\mathrm{CF}_{3} \mathrm{COOAg}(0.10 \mathrm{mmol}, 22.1 \mathrm{mg})$ were dissolved together in a mixed solvent of ${ }^{i} \mathrm{PrOH}$ and DMF $(4.0 \mathrm{~mL}, v: v=3: 1)$, and then, $50 \mu \mathrm{~L}$ of $\mathrm{CF}_{3} \mathrm{COOH}$ was added to the above solution. The mixture was sealed in a $15-\mathrm{mL}$ Teflon-lined reaction vessel and kept at $80^{\circ} \mathrm{C}$ for $0-36 \mathrm{~h}(\mathbf{0}, \mathbf{1}, \mathbf{2}, \mathbf{3}, \mathbf{4}, \mathbf{5}, \mathbf{6}, \mathbf{8}, \mathbf{1 0}, \mathbf{1 2}, \mathbf{1 5}, \mathbf{1 8}, \mathbf{2 4}$, and 36 h). After cooling to room temperature, the solution was filtered and evaporated in the dark. Different crystals were obtained by evaporating the mother liquor from different reaction times at room temperature: 0 h , colorless block crystals $\left(\mathbf{A g}_{14}\right)$; $3-6$ h, yellow block crystals $\left(\mathbf{A g}_{24}\right) ; 8-24$ h, black octahedral crystals $\left(\mathbf{A g}_{70} \cdot \mathbf{A g}_{12}\right) ; 36 \mathrm{~h}$, black rectangular crystals $\left(\mathbf{A g}_{70}\right)$.

The acquisition of $\mathbf{A g}_{70} \cdot \mathbf{A g}_{12}$ as a transition product shows that when the number of $\mathrm{Ag}_{70}$ was relatively small, the $\mathrm{Ag}_{70}$ nanoclusters tend to co-crystallize with small Ag species. With most of the silver species transformed into $\mathrm{Ag}_{70}$, the nanoclusters will crystallize by themselves and precipitate out.

### 2.2. Different amounts of DMF

$\{\operatorname{Ag}(\mathrm{S} \operatorname{Pr})\}_{n}(0.05 \mathrm{mmol}, 9 \mathrm{mg})$ and $\mathrm{CF}_{3} \mathrm{COOAg}(0.10 \mathrm{mmol}, 22.1 \mathrm{mg})$ were dissolved together in a mixed solvent of (4-x) $\mathrm{mL}^{i} \operatorname{PrOH}$ and $\mathrm{x} \mathrm{mL} \operatorname{DMF}(\mathbf{x}=\mathbf{0}, \mathbf{0 . 2}, \mathbf{0} .4, \mathbf{0 . 6}, \mathbf{0 . 8}, \mathbf{1 . 0}, \mathbf{1 . 2}, \mathbf{1 . 4}, \mathbf{1 . 6}, \mathbf{1 . 8}, \mathbf{2} .0, \mathbf{3 . 0}$, and 4.0), and then, $50 \mu \mathrm{~L}$ of $\mathrm{CF}_{3} \mathrm{COOH}$ was added to the above solution. The mixture was sealed in a $15-\mathrm{mL}$ Teflon-lined reaction vessel and kept at $80^{\circ} \mathrm{C}$ for 24 h . After cooling to room temperature, the solution was filtered and evaporated in the dark. After several days of evaporation of mother liquor from different reaction conditions at room temperature, different crystals were obtained: 1.0 mL DMF $\left(3.0 \mathrm{~mL}{ }^{i} \mathrm{PrOH}\right)$ and 1.2 mL DMF ( $2.8 \mathrm{~mL}{ }^{i} \mathrm{PrOH}$ ), black octahedral crystals $\left(\mathbf{A g}_{70} \cdot \mathbf{A g}_{12}\right) ; 1.4 \mathrm{~mL}$ DMF ( 2.6 $\left.\mathrm{mL}{ }^{i} \mathrm{PrOH}\right)$, black octahedral crystals $\left(\mathbf{A g}_{70} \mathbf{}^{\mathbf{A}} \mathbf{A g}_{12}\right)$ and black rectangular crystals $\left(\mathbf{A g}_{70}\right) ; 1.6 \mathrm{~mL}$ DMF ( $2.4 \mathrm{~mL}{ }^{i} \mathrm{PrOH}$ ), black rectangular crystals $\left(\mathbf{A g}_{70}\right)$; others, no crystals.

### 2.3. Different amounts of $\mathrm{CF}_{3} \mathbf{C O O H}$

$\left\{\operatorname{Ag}\left(\mathrm{S}^{\mathrm{i}} \mathrm{Pr}\right)\right\}_{n}(0.05 \mathrm{mmol}, 9 \mathrm{mg})$ and $\mathrm{CF}_{3} \mathrm{COOAg}(0.10 \mathrm{mmol}, 22.1 \mathrm{mg})$ were dissolved together in a mixed solvent of $3 \mathrm{~mL}{ }^{i} \mathrm{PrOH}$ and 1 mL DMF, and then, a certain amount of $\mathrm{CF}_{3} \mathrm{COOH}(\mathbf{0}, \mathbf{1 0}, \mathbf{2 0}, \mathbf{3 0}, \mathbf{4 0}, \mathbf{5 0}, \mathbf{6 0}, \mathbf{7 0}, \mathbf{8 0}, \mathbf{9 0}, \mathbf{1 0 0}, \mathbf{1 2 5}, \mathbf{1 5 0}$, $\mathbf{1 7 5}, \mathbf{2 0 0}, \mathbf{2 5 0} \mu \mathrm{L}$ ) was added to the above solution. The mixture was sealed in a $15-\mathrm{mL}$ Teflon-lined reaction vessel and kept at $80^{\circ} \mathrm{C}$ for 24 h . After cooling to room temperature, the solution was filtered and evaporated in the dark. After several days of evaporation of mother liquor from different reaction conditions at room temperature, different crystals were obtained: 40 , 50 , and $60 \mu \mathrm{LF}_{3} \mathrm{COOH}$, black octahedral crystals $\left(\mathbf{A g}_{70} \cdot \mathbf{A g}_{12}\right) ; 70 \mu \mathrm{LF}_{3} \mathrm{COOH}$, black octahedral crystals $\left(\mathbf{A g}_{70} \cdot \mathbf{A g}_{\mathbf{1 2}}\right)$ and black rectangular crystals $\left(\mathbf{A g}_{70}\right) ; 80,90$, and $100 \mu \mathrm{~L} \mathrm{CF}_{3} \mathrm{COOH}$, black rectangular crystals $\left(\mathbf{A g}_{70}\right)$; others, no crystals.

## Results and Discussion

## Section S3. Supplementary Figures

### 3.1 Tracking the reaction process based on the colour and UV-Vis of mother liquor

A series of improved experiments (Figs. S1-S4) were used to achieve our goal: $\{\operatorname{Ag}(\mathrm{S} \operatorname{Pr})\}_{\mathrm{n}}(0.05 \mathrm{mmol}, 9 \mathrm{mg})$ and $\mathrm{CF}_{3} \mathrm{COOAg}(0.10 \mathrm{mmol}, 22 \mathrm{mg})$ together with $\mathrm{CF}_{3} \mathrm{COOH}(0-250 \mu \mathrm{~L})$ were mixed and reacted in the 4 mL organic solvent containing DMF and ${ }^{i} \mathrm{PrOH}$, under solvothermal conditions at $80^{\circ} \mathrm{C}(1-36 \mathrm{~h})$.

Through different reaction time $(1-36 \mathrm{~h})$ to control the reduction process $\left(\mathrm{CF}_{3} \mathrm{COOH}: 50 \mu \mathrm{~L} ; \mathrm{DMF}: 1 \mathrm{~mL} ;{ }^{i} \operatorname{PrOH}: 3\right.$ mL ), the color of the mother liquor is significantly different (Fig. 1). From colorless ( $0-1 \mathrm{~h}$ ) to yellow ( $2-3 \mathrm{~h}$ ), then to orange $(4-6 \mathrm{~h})$, red $(8-10 \mathrm{~h})$, and finally to black red (over 12 h ), this indicates that the reduction degree of the system gradually deepened. Time-dependent UV-Vis absorption spectra (Fig. 1b and Fig. S1) show the characteristic peak (ca. 530 nm ) of $\mathbf{A g}_{70}$ appeared after 4 hours (Fig. S1d), corresponding to the change of mother liquor from yellow to orange (Fig. 1). After reaction for 24 hours, UV-Vis spectra of mother liquor were basically consistent with that of $\mathbf{A g}_{70}$ (Fig. S1c). Interestingly, when the mother liquor was yellow (reaction time: 2-3 h), only a characteristic absorption sharp peak (416 nm ) that did not belong to the $\mathbf{A g}_{70}$ appeared in the UV-Vis spectrum (Fig. S1d), suggesting that intermediate substances may have been formed during the formation of $\mathbf{A g}_{70}$. The product of the reaction for 3 hours was filtered and evaporated at room temperature to obtain yellow crystals (Fig. 2c), $\mathrm{S} @ \mathrm{Ag}_{24}\left(\mathrm{~S}^{i} \operatorname{Pr}\right)_{8}\left(\mathrm{CF}_{3} \mathrm{COO}\right)_{10}(\mathrm{DMF})_{10}, \mathbf{A g}_{24}$ in short. The characteristic absorption peak ( ca. 420 nm ) of $\mathbf{A g}_{24}$ corresponds well with mother liquor (reaction time: 3 h ), indicating that the main substance in the mother liquor at this time is $\mathbf{A g}_{24}$ clusters. With the continuous generation of $\mathbf{A g}_{24}$ in the mother liquor, multiple $\mathbf{A g}_{24}$ clusters with high reactive activity generate more stable $\mathbf{A g}_{70}$ through collision, self-assembly and fusion, so the characteristic peak ( $c a .530 \mathrm{~nm}$ ) of $\mathbf{A g}_{70}$ gradually appears and rapidly increases (Fig. S1a-b).

Parallel experiments (variable: DMF (Figs. S2-S3) or $\mathrm{CF}_{3} \mathrm{COOH}$ (Fig. S4)) also have similar phenomena, which suggest intermediate substances. The appropriate amount (ca. $1.0-1.6 \mathrm{~mL}$ ) of DMF can effectively prepare $\mathbf{A g}_{70}$ clusters (Fig.S2). $\mathbf{A g}_{70}$ cannot be generated effectively if the DMF content in the mixed solution is too low (ca. $0.2-0.8 \mathrm{~mL}$, Fig. S2) or too high ( $c a .1 .8-4.0 \mathrm{~mL}$, Figs. S2-S3). As shown in Fig. S2b, when DMF content is low ( $c a .0 .2-0.8 \mathrm{~mL}$ ), the characteristic peak of $\mathbf{A g}_{24}$ is obvious, while $\mathbf{A g} \mathbf{g}_{70}$ is weak. It may be caused by the poor efficiency of conversion from $\mathbf{A g}_{24}$ to $\mathbf{A g}_{70}$. As shown in Fig. S2c and Fig. S3, when DMF content is large (ca. $1.8-4.0 \mathrm{~mL}$ ), no characteristic peak was observed, possibly caused by the inability to form $\mathbf{A g}_{24}$ (ca. $1.8-4.0 \mathrm{~mL}$ ).

The introduction of $\mathrm{CF}_{3} \mathrm{COOH}$ may be a necessary factor in the formation of $\mathbf{A g}_{24}$ (Fig. S4). As shown in Fig. S4b, $\mathbf{A g}_{24}$ cannot be formed without or with only a small amount ( $10 \mu \mathrm{~L}$ ) of $\mathrm{CF}_{3} \mathrm{COOH}$. Meanwhile, excess acid ( $>100 \mu \mathrm{~L}$ ) also inhibits the formation of the products (Fig. S4c). Increasing the amount of $\left\{\operatorname{Ag}\left(\mathrm{S}^{i} \operatorname{Pr}\right)\right\}_{\mathrm{n}}(0.05 \mathrm{mmol} \rightarrow 0.10 \mathrm{mmol})$ in the reactants had little effect on the final result (Fig. S5).

Fig. S1 (a) UV-Vis absorption spectra of mother liquor after solvothermal reaction at different times of 3, 4, 5, 6, and 12 hours (diluted 5 times by DMF). (b) UV-Vis absorption spectra of mother liquor after solvothermal reaction at different times of $6,8,10,12,18,24$, and 36 hours (diluted 30 times by DMF). (c) Comparing the UV-Vis absorption spectra of $\mathbf{A g}_{77}, 24 \mathrm{~h}$ and 36 h mother liquor. (d) UV-Vis absorption spectra of mother liquor after 3 h solvothermal reaction (diluted 2, 5, and 30 times by DMF).

Fig. S2 (a) The color of mother liquor after solvothermal reaction at different mixture solvents $\left(\mathrm{v}(\mathrm{DMF})+\mathrm{v}\left({ }^{i} \operatorname{PrOH}\right)=4 \mathrm{~mL}\right)$ : the volume of DMF is $0.2,0.4,0.6,0.8,1.0,1.2,1.4,1.6,1.8$, and 2.0 mL , respectively (from left to right). (b-c) Time-dependent UV-Vis absorption spectra for tracking the reaction process (diluted 30 times by DMF). Specific methods are as follows: transfer $100 \mu \mathrm{~L}$ of mother liquor to a quartz cuvette, and then put 2.9 mL DMF to dilute the sample.

Fig. S3 (a) The color of mother liquor after solvothermal reaction at different mixture solvents $\left(\mathrm{v}(\mathrm{DMF})+\mathrm{v}\left({ }^{( } \operatorname{PrOH}\right)=4 \mathrm{~mL}\right)$ : the volume of DMF is $0.0,0.2,0.4,0.6,0.8,1.0,2.0,3.0$, and 4.0 mL , respectively (from left to right). (b) Time-dependent UV-Vis absorption spectra for tracking the 3 a reaction process (diluted 30 times by DMF).

Fig. S4 (a) The color of mother liquor after solvothermal reaction at different $\mathrm{CF}_{3} \mathrm{COOH}$. From left to right, the volume of CFCOOH is $0,10,20,30$, $40,50,60,70,80$ and $90 \mu \mathrm{~L}$, respectively. (b) Time-dependent UV-Vis absorption spectra for tracking the 4a reaction process (diluted 30 times by DMF). (c) The color of mother liquor after solvothermal reaction at different $\mathrm{CF}_{3} \mathrm{COOH}$. From left to right, the volume of CFCOOH is $0,10,20,50$, $100,125,150,175,200$ and $250 \mu \mathrm{~L}$, respectively. (d) Time-dependent UV-Vis absorption spectra for tracking the 4 c reaction process (diluted 30 times by DMF).

Fig. S5 (a, b) The color of mother liquor after solvothermal reaction ( $13.5 \mathrm{mg}\left\{\mathrm{Ag}\left(\mathrm{S}^{\prime} \mathrm{Pr}\right)\right\}_{n}, 22 \mathrm{mg} \mathrm{CF}{ }_{3} \mathrm{COOAg}^{2}$, and $50 \mu \mathrm{~L} \mathrm{CF}_{3} \mathrm{COOH}$ in mixture solvent ( $\mathrm{PrOH}: \mathrm{DMF}=3: 1$ ) at $80^{\circ} \mathrm{C}$ ) for different times ( $1,2,3,4,5,6,8,10,12,18,24,48$, and 72 hours); (c, d) UV-Vis absorption spectra (diluted 10 times by DMF). Among them, mother liquor ( 18 and 24 h ) in (d) was diluted 20 times for comparison.

Fig. S6 (a) Negative ion mode ESI-MS in range of $m / z=2000-8000$ on the reaction of $10 \mathrm{mg}\left\{\mathrm{Ag}\left(\mathrm{SCH}\left(\mathrm{CH}_{3}\right)\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right)\right)\right\} n, 22 \mathrm{mg} \mathrm{CF} 3_{3} \mathrm{COOAg}$, and $50 \mu \mathrm{LCF}_{3} \mathrm{COOH}$ in mixture solvent ( ${ }^{( } \mathrm{PrOH}$ : DMF $=3: 1$ ) at 3 and 12 hours at $80^{\circ} \mathrm{C}$. (b) Negative ion mode ESI-MS in range of $m / z=2000-8000$ on the reaction of $10 \mathrm{mg}\left\{\mathrm{Ag}\left(\mathrm{SCH}\left(\mathrm{CH}_{3}\right)_{2}\right)\right\}_{n}, 30 \mathrm{mg} \mathrm{C}_{2} \mathrm{~F}_{5} \mathrm{COOAg}$, and $70 \mu \mathrm{LC}_{2} \mathrm{~F}_{5} \mathrm{COOH}$ in mixture solvent ( $\mathrm{PrOH}: \mathrm{DMF}=3: 1$ ) at 3 and 24 hours at $80^{\circ} \mathrm{C}$. (b)

(c)

(e)

(f)

Fig. S11 The crystal structure of $\mathbf{A g}_{14}$. (a) The total structure. (b) The asymmetric unit. (c) The middle silver ring protected and stablized by $\mathrm{CF}_{3} \mathrm{COO}^{-}$ and DMF. (d) The coordination modes of three crystallographically independent S atoms from different $\mathrm{S}^{\mathrm{i}} \mathrm{Pr}^{-}$ligands. (e) $\mathrm{The} \mathrm{Ag}-\mathrm{S}$ skeleton of $\mathbf{A g}_{14}$. (f) The Ag - S skeleton of the $\mathrm{Ag}_{12}$ of $\mathbf{A g}_{70} \cdot \mathbf{A g}_{12}$. It can be considered that $\mathrm{Ag}_{14}$ is missing two horns ( Ag ions). Atom color codes: green, Ag ; yellow, S; red, O; bright green, F; blue, N; grey, C. All hydrogen atoms are omitted for clarity. Symmetry code: i $1.5-\mathrm{x}, 1.5-\mathrm{y}, 1-\mathrm{z}$.

SCXRD result shows that $\mathbf{A g}_{14}\left(\mathrm{Ag}_{14}\left(\mathrm{~S}^{i} \mathrm{Pr}\right)_{6}\left(\mathrm{CF}_{3} \mathrm{COO}\right)_{8}(\mathrm{DMF})_{6}\right.$, Fig. S11a) crystallizes in monoclinic space group $C 2 / c$ (No. 15) and half a cluster $\left(\mathrm{Ag}_{7}\left(\mathrm{SPr}^{i}\right)_{3}\left(\mathrm{CF}_{3} \mathrm{COO}\right)_{4}(\mathrm{DMF})_{3}\right)$ exists in the asymmetric unit (Fig. S11b). $\mathbf{A g}_{14}$ is a centrosymmetric ellipsoidal cluster and contains an $\mathrm{Ag}_{14} \mathrm{~S}_{6}$ shell (Fig. S11e) protected by eight $\mathrm{CF}_{3} \mathrm{COO}^{-}$ and six DMF molecules. Based on their coordination modes, six $\mathrm{S}^{i} \mathrm{Pr}^{-}$ligands are divided into two types comprised of $4 \mu_{4}$ ( $\mathrm{Ag}_{4}$ trapezoids) and $2 \mu_{5}$ ( $\mathrm{Ag}_{5}$ pentagon) modes (Fig. S 11 d ) with $\mathrm{Ag}-\mathrm{S}$ bond lengths ranging from $2.462(4)-2.550(5) \AA, 2.473(4)-2.682(5) \AA$, respectively. By sharing vertices with each other, the $\mathrm{Ag}_{4}$ trapezoids and $\mathrm{Ag}_{5}$ pentagons are linked together to form a hollow ellipsoidal $\mathrm{Ag}_{14} \mathrm{~S}_{6}$ cage, which exhibits a three-layer $\mathrm{Ag}_{3}-\mathrm{Ag}_{8}-\mathrm{Ag}_{3}$ (triangle-octagon-triangle) skeletal arrangement. The distances of $\mathrm{Ag} \cdots \mathrm{Ag}$ interactions range from $2.835(3)$ to $3.335(3) \AA$ (Table S2), indicating that there are significant argentophilic interactions in consolidating the $\mathbf{A g}_{14}$ cluster. The $\mathrm{Ag}_{3}$ triangle at both ends is covered and stabilized by one $\mathrm{CF}_{3} \mathrm{COO}^{-}$ligand (coordination mode: $\mu_{2}-\eta^{1}, \eta^{1}$ ) and one DMF molecule, while $\mathrm{Ag}_{8}$ octagon ring in the middle is surrounded by six $\mathrm{CF}_{3} \mathrm{COO}^{-}$ligands (coordination modes: $\mu_{2}-\eta^{1}, \eta^{1}$ and $\mu_{3}-\eta^{1}: \eta^{2}$ ) and four DMF molecules on the outside. The $\mathrm{Ag}-\mathrm{O}\left(\mathrm{CF}_{3} \mathrm{COO}^{-}\right)$and $\mathrm{Ag}-\mathrm{O}(\mathrm{DMF})$ bond lengths span from 2.24(3)-2.77(3) $\AA, 2.28(3)-2.51(2) \AA$, respectively.

Fig. S12 The crystal structure of $\mathbf{A g}_{24}$ and $\mathbf{A g}_{24}-\mathbf{C}_{\mathbf{2}} \mathbf{F}_{5}$. (a) The asymmetric unit of $\mathbf{A g}_{24}$. (b) The total structure of $\mathbf{A g}_{24}$, containing two asymmetric units sharing a $S$ atom (S5) at the inversion center (i). (c) The asymmetric unit of $\mathbf{A g}_{24}-\mathbf{C}_{2} \mathbf{F}_{5}$. (d) The total structure of $\mathbf{A g}_{24}-\mathbf{C}_{2} \mathbf{F}_{5}$.
