## 1. Experimental Section

### 1.1. Materials and measurements

Unless otherwise stated, all chemicals were obtained from commercial sources and used as received. Compounds 1 and 2 were prepared according to literature procedures. ${ }^{1,2,3}\left[\mathrm{Pd}\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{4}\right]\left(\mathrm{ClO}_{4}\right)_{2}$, $\left[\mathrm{Pd}\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{4}\right]\left(\mathrm{PF}_{6}\right)_{2},\left[\mathrm{Pd}\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{4}\right]\left(\mathrm{SbF}_{6}\right)_{2},\left[\mathrm{Pd}\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{4}\right](\mathrm{OTf})_{2}$ and $\left[\mathrm{Pd}\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{4}\right](\mathrm{NTf})_{2}$ were prepared in situ by reacting $\mathrm{Pd}\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{2} \mathrm{Cl}_{2}$ with the respective silver salt in a 1:2 ratio. The AgCl precipitate was separated from the solution by centrifugation. Infrared spectra (IR) were collected on a Pelkin Elmer Spectrum Two spectrometer. Electrospray ionization (ESI) mass spectra were recorded on a Bruker Apex IV ESI-FTICR Mass Spectrometer with a dual electrospray ionization source. Ion-Mobility mass spectrometry was carried out with a Bruker timsTOF instrument. GPC purification of ligand L was performed on a JASCO LC-9210 II NEXT apparatus. Isothermal Titration Calorimetry (ITC) measurements were performed on a Malvern MicroCal PEAQ-ITC instrument at $25^{\circ} \mathrm{C}$.

### 1.2.Synthesis of Ligand (L)

1
$\mathrm{R}=\mathrm{C}_{6} \mathrm{H}_{13}$
$\mathrm{Pd}\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{2} \mathrm{Cl}_{2}$ Cul $\left[(t \mathrm{Bu})_{3} \mathrm{PH}^{2} \mathrm{BF}_{4}\right.$

### 1.2.1. Synthesis of 9-hexyl-3,6-bis(isoquinolin-8-ylethynyl)-9H-carbazole (L)

Compound 1 ( $0.310,0.758 \mathrm{mmol}$ ) and compound $2(0.273 \mathrm{~g}, 1.78 \mathrm{mmol})$ were combined in a mixture of dioxane and triethylamine ( $3: 1,12 \mathrm{~mL}$ ) in a Schlenk vessel. Once the solvent was degassed (via freeze-thaw cycles), $\mathrm{Pd}\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{2} \mathrm{Cl}_{2}(0.012 \mathrm{~g}, 0.046 \mathrm{mmol})$, $\mathrm{Cul}(0.008 \mathrm{~g}, 0.042 \mathrm{mmol}$ ), and tri-tert-butylphosphonium tetrafluoroborate ( $0.024 \mathrm{~g}, 0.083 \mathrm{mmol}$ ) were added in one portion. The reaction mixture was subsequently heated at $80^{\circ} \mathrm{C}$ for 16 h . Once allowed to cool, the mixture was diluted with ethyl acetate ( 20 mL ) and the salts were removed by filtration. After concentrating under reduced pressure, the residue was purified by column chromatography ( $9: 1$ dichloromethane/methanol) followed by GPC to yield the title compound as a pale brown solid ( $0.212 \mathrm{~g}, 51 \%$ ). Mp 163.2 - $164.4^{\circ} \mathrm{C}$; $V_{\max }\left(\right.$ neat, $\mathrm{cm}^{-1}$ ): 2924 (w), 2199 (m), 1612 (m), 1566 (s), 1484 (s), 1466 (m). ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 9.95\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{H}_{\mathrm{i}}\right), 8.63\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{H}_{\mathrm{h}}\right), 8.47\left(\mathrm{~d}, \mathrm{~J}=1.6 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{H}_{\mathrm{c}}\right), 7.88$ (dd, $\left.J=7.2,1.1 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{H}_{\mathrm{d}}\right), 7.84-7.78\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{H}_{\mathrm{b}}, \mathrm{H}_{\mathrm{f}}\right), 7.73-7.66\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{H}_{\mathrm{g}}, \mathrm{H}_{\mathrm{e}}\right), 7.47(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 2 \mathrm{H}$, $H_{\mathrm{a}}$ ), $4.36\left(\mathrm{t}, J=7.4 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 1.93\left(\mathrm{p}, J=7.4 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 1.48-1.26\left(\mathrm{~m}, 6 \mathrm{H}, 3 \times \mathrm{CH}_{2}\right), 0.89(\mathrm{t}, J=7.0$ $\left.\mathrm{Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}\right) .{ }^{13} \mathrm{C}$ NMR (150 MHz, $\mathrm{CDCl}_{3}$ ) $\delta$ 151.62, 143.85, 140.96, 135.97, 131.20, 130.10, 130.03, 128.21, $126.58,124.72,122.75,122.44,120.68,113.61,109.44,97.41,84.49,43.63,31.69,29.13,27.10,22.71$, 14.17. MS-ESI: $m / z$ : calculated for $\mathrm{C}_{40} \mathrm{H}_{31} \mathrm{~N}_{3}[\mathrm{M}+\mathrm{H}]+553.3$, found 553.3.

Figure S1. Partial ${ }^{1} \mathrm{H}$ NMR spectrum $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ of $\mathbf{L}$.

Figure S2. ${ }^{13} \mathrm{C}$ NMR spectrum ( $150 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) of $\mathbf{L}$.

### 1.3. Synthesis of $\mathrm{Pd}_{2} \mathrm{~L}_{4}$ cages

General procedure: Ligand $\mathbf{L}(4.8 \mathrm{mg}, 8.7 \mu \mathrm{~mol})$ was completely dissolved in $\mathrm{CD}_{3} \mathrm{CN}(2800 \mu \mathrm{~L})$ with the aid of sonication and heating. A solution of the corresponding $\operatorname{Pd}(\mathrm{II})$ salt ( $300 \mu \mathrm{~L}, 15 \mathrm{mM} / \mathrm{CD}_{3} \mathrm{CN}, 4.5 \mu \mathrm{~mol}$ ) was subsequently added and the mixture was heated at $70^{\circ} \mathrm{C}$ for various time periods to afford an orange-coloured solution of the $\mathrm{Pd}_{2} \mathrm{~L}_{4}$ cage in $\mathrm{CD}_{3} \mathrm{CN}$.

Figure S3. An example of the typical shifting observed by ${ }^{1} \mathrm{H}$ NMR spectroscopy when $L$ is reacted with $\mathrm{Pd}^{11}$. ${ }^{1} \mathrm{H}$ NMR spectra ( 500 MHz , $\mathrm{CD}_{3} \mathrm{CN}$ ): a) $\mathbf{L}$; b) a 2:1 mixture of $\mathbf{L}$ and $\left[\mathrm{Pd}\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{4}\right]\left(\mathrm{BF}_{4}\right)_{2}$ heated at $70^{\circ} \mathrm{C}$ for 1 h .

### 1.3.1. Synthesis of $\left[\mathrm{Pd}_{2} \mathrm{~L}_{4}\right]\left(\mathrm{NO}_{3}\right)_{4}\left(\mathbf{1} \cdot \mathrm{NO}_{3}\right)$

$\mathrm{Pd}\left(\mathrm{NO}_{3}\right)_{2}$ and L were combined according to the general procedure and heated at $70^{\circ} \mathrm{C}$ for 5 minutes to afford 1- $\mathrm{NO}_{3} .{ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{CN}$ ) $\delta 9.26\left(\mathrm{~s}, 8 \mathrm{H}, \mathrm{H}_{\mathrm{i}}\right), 8.60\left(\mathrm{~d}, J=1.6 \mathrm{~Hz}, 8 \mathrm{H}, \mathrm{H}_{\mathrm{c}}\right), 7.68\left(\mathrm{~d}, J=6.4 \mathrm{~Hz}, 8 \mathrm{H}, \mathrm{H}_{\mathrm{h}}\right)$, $7.47\left(\mathrm{~d}, J=6.4 \mathrm{~Hz}, 8 \mathrm{H}, \mathrm{H}_{\mathrm{g}}\right), 7.44\left(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 8 \mathrm{H}, \mathrm{Hf}_{\mathrm{f}}\right), 7.31\left(\mathrm{dd}, J=8.4,7.2 \mathrm{~Hz}, 8 \mathrm{H}, \mathrm{H}_{\mathrm{e}}\right), 7.08(\mathrm{~d}, J=8.4 \mathrm{~Hz}$, $\left.8 \mathrm{H}, \mathrm{H}_{\mathrm{a}}\right), 6.73\left(\mathrm{dd}, J=8.4,1.6 \mathrm{~Hz}, 8 \mathrm{H}, \mathrm{H}_{\mathrm{b}}\right), 6.33\left(\mathrm{dd}, J=7.2,1.0 \mathrm{~Hz}, 8 \mathrm{H}, \mathrm{H}_{\mathrm{d}}\right), 4.52-4.37(\mathrm{~m}, 4 \mathrm{H}, \mathrm{CH}), 4.35-$ $4.22(\mathrm{~m}, 4 \mathrm{H}, \mathrm{CH}), 2.10-1.99\left(\mathrm{~m}, 8 \mathrm{H}, \mathrm{CH}_{2}\right), 1.73-1.39\left(\mathrm{~m}, 24 \mathrm{H}, 3 \times \mathrm{CH}_{2}\right), 1.01\left(\mathrm{t}, \mathrm{J}=7.3,7.3 \mathrm{~Hz}, 12 \mathrm{H}, \mathrm{CH}_{3}\right)$. ${ }^{13} \mathrm{C}$ NMR (151 MHz, CD ${ }_{3} \mathrm{CN}$ ) $\delta 156.93$, 144.51, 141.06, 137.05, 134.28, 130.62, 129.15, 128.85, 126.62, $126.19,124.64,124.00,123.18,112.08,109.51,100.26,81.23,44.08,32.32,30.29,27.80,23.48,14.39$.

Figure S4. ${ }^{1} \mathrm{H}$ NMR spectrum $\left(500 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{CN}\right)$ of $\mathbf{1} \cdot \mathrm{NO}_{3}$

Figure S5. ${ }^{13} \mathrm{C}$ NMR spectrum $\left(150 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{CN}\right)$ of $\mathbf{1} \cdot \mathrm{NO}_{3}$.

Figure S6. ESI-MS spectrum of $1 \cdot \mathrm{NO}_{3}$. The spectrum shows peaks of $\left[\mathrm{Pd}_{2} \mathrm{~L}_{4}+n \mathrm{NO}_{3}\right]^{4-n+}(n=0-2)$ and the measured and calculated isotope pattern of $\left[\mathrm{Pd}_{2} \mathrm{~L}_{4}+\mathrm{NO}_{3}\right]^{3+}$ is also shown.

Figure S7. ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY spectrum $\left(600 \mathrm{MHz} / \mathrm{CD}_{3} \mathrm{CN}\right)$ of $\mathbf{1} \cdot \mathrm{NO}_{3}$.

Figure S8. ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ NOESY spectrum $\left(600 \mathrm{MHz} / \mathrm{CD}_{3} \mathrm{CN}\right)$ of $\mathbf{1} \cdot \mathrm{NO}_{\mathbf{3}}$.

### 1.3.2. Synthesis of $\left[\mathrm{BF}_{4} @ \mathrm{Pd}_{2} \mathrm{~L}_{4}\right]\left(\mathrm{BF}_{4}\right)_{3}\left(1 \cdot B F_{4}\right)$

$\left[\mathrm{Pd}\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{4}\right]\left(\mathrm{BF}_{4}\right)_{2}$ and $\mathbf{L}$ were combined according to the general procedure and heated at $70^{\circ} \mathrm{C}$ for 1 h to afford 1. $\mathrm{BF}_{4}$. ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{CN}$ ) $\delta 9.37\left(\mathrm{~s}, 8 \mathrm{H}, \mathrm{Hi}_{\mathrm{i}}\right), 8.38\left(\mathrm{~d}, \mathrm{~J}=1.6 \mathrm{~Hz}, 8 \mathrm{H}, \mathrm{H}_{\mathrm{c}}\right), 7.52(\mathrm{~d}, \mathrm{~J}=6.4 \mathrm{~Hz}$, $\left.8 \mathrm{H}, \mathrm{H}_{\mathrm{h}}\right), 7.39\left(\mathrm{~d}, J=6.4 \mathrm{~Hz}, 8 \mathrm{H}, \mathrm{H}_{\mathrm{g}}\right), 7.28\left(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 8 \mathrm{H}, \mathrm{H}_{\mathrm{f}}\right), 7.17\left(\mathrm{dd}, J=8.4,7.2 \mathrm{~Hz}, 8 \mathrm{H}, \mathrm{H}_{\mathrm{e}}\right), 7.13(\mathrm{~d}, J$ $\left.=8.4 \mathrm{~Hz}, 8 \mathrm{H}, \mathrm{H}_{\mathrm{a}}\right), 6.91\left(\mathrm{dd}, J=8.3,1.6 \mathrm{~Hz}, 8 \mathrm{H}, \mathrm{H}_{\mathrm{b}}\right), 6.27\left(\mathrm{dd}, J=7.2,1.0 \mathrm{~Hz}, 8 \mathrm{H}, \mathrm{H}_{\mathrm{d}}\right), 4.47-4.32(\mathrm{~m}, 4 \mathrm{H}$, $\mathrm{CH}), 4.32-4.20(\mathrm{~m}, 4 \mathrm{H}, \mathrm{CH}), 2.08-1.99\left(\mathrm{~m}, 8 \mathrm{H}, \mathrm{CH}_{2}\right), 1.72-1.63\left(\mathrm{~m}, 8 \mathrm{H}, \mathrm{CH}_{2}\right), 1.63-1.55\left(\mathrm{~m}, 8 \mathrm{H}, \mathrm{CH}_{2}\right)$, $1.55-1.44\left(\mathrm{~m}, 8 \mathrm{H}, \mathrm{CH}_{2}\right), 1.03\left(\mathrm{t}, \mathrm{J}=7.3,7.3 \mathrm{~Hz}, 12 \mathrm{H}, \mathrm{CH}_{3}\right) .{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{CN}$ ) $\delta 157.43,144.59$, $140.99,137.17,134.10,130.14,129.41,128.67,127.04,125.76,124.70,123.64,123.36,112.35,109.38$, $101.05,81.80,44.07,32.34,30.29,27.85,23.52,14.43 .{ }^{19} \mathrm{~F}$ NMR ( $377 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{CN}$ ) $\delta-149.35$ ( 4 F , br, encapsulated $\mathrm{BF}_{4}{ }^{-}$), -151.79 ( 12 F , free $\mathrm{BF}_{4}{ }^{-}$).

### 1.3.7. Synthesis of $\left[\mathrm{ReO}_{4} @ \mathrm{Pd}_{2} \mathrm{~L}_{4}\right]\left(\mathrm{NO}_{3}\right)_{3}\left(\mathbf{1} \cdot \mathrm{ReO}_{4}\right)$

To a sample of $\left[\mathrm{Pd}_{2} \mathrm{~L}_{4}\right]\left(\mathrm{NO}_{3}\right) 4\left(0.7 \mathrm{mM}, 600 \mu \mathrm{~L}, \mathrm{CD}_{3} \mathrm{CN}\right)$, 1.1 equivalents of tetrabutylammonium perrhenate was added at $25{ }^{\circ} \mathrm{C}$ to immediately give 1•ReO4. ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{CN}$ ) $\delta 9.46\left(\mathrm{~s}, 8 \mathrm{H}, \mathrm{Hi}_{\mathrm{i}}\right), 8.20(\mathrm{~d}, J=$ $1.6 \mathrm{~Hz}, 8 \mathrm{H}, \mathrm{H}_{\mathrm{c}}$ ), $7.58\left(\mathrm{~d}, J=6.4 \mathrm{~Hz}, 8 \mathrm{H}, \mathrm{H}_{\mathrm{h}}\right), 7.38\left(\mathrm{~d}, J=6.4 \mathrm{~Hz}, 8 \mathrm{H}, \mathrm{H}_{\mathrm{g}}\right), 7.25-7.12\left(\mathrm{~m}, 16 \mathrm{H}, \mathrm{H}_{\mathrm{f}}, \mathrm{H}_{\mathrm{a}}\right), 7.10-$ $6.99\left(\mathrm{~m}, 16 \mathrm{H}, \mathrm{H}_{\mathrm{e}}, \mathrm{H}_{\mathrm{b}}\right), 6.22\left(\mathrm{~d}, J=7.3 \mathrm{~Hz}, 8 \mathrm{H}, \mathrm{H}_{\mathrm{d}}\right), 4.49-4.12\left(\mathrm{~m}, 8 \mathrm{H}, \mathrm{CH}_{2}\right), 2.07-2.00\left(\mathrm{~m}, 8 \mathrm{H}, \mathrm{CH}_{2}\right), 1.72-$ $1.56\left(\mathrm{~m}, 16 \mathrm{H}, 2 \times \mathrm{CH}_{2}\right), 1.54-1.45\left(\mathrm{~m}, 8 \mathrm{H}, \mathrm{CH}_{2}\right), 1.03\left(\mathrm{t}, \mathrm{J}=7.2 \mathrm{~Hz}, 12 \mathrm{H}, \mathrm{CH}_{3}\right)$.

Figure S40. Partial ${ }^{1} \mathrm{H}$ NMR spectrum $\left(500 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{CN}\right)$ of $\mathbf{1} \cdot \mathbf{R e O}_{4}$ obtained by the addition of 1.1 equivalents of tetrabutylammonium perrhenate to a sample of $\left[\mathrm{Pd}_{2} \mathrm{~L}_{4}\right]\left(\mathrm{NO}_{3}\right)_{4}$ in $\mathrm{CD}_{3} \mathrm{CN}$.

Figure S41. ESI-MS spectrum of $\mathbf{1} \cdot \mathrm{ReO}_{4}$. The spectrum shows peaks of $\left[\mathrm{Pd}_{2} \mathbf{L}_{4}+n \mathrm{ReO}_{4}\right]^{4-n+}(n=1,2)$ and the measured and calculated isotope pattern of $\left[\mathrm{Pd}_{2} \mathrm{~L}_{4}+\mathrm{ReO}_{4}\right]^{3+}$ is also shown.

### 1.3.8. Synthesis of $\left[\mathrm{Pd}_{2} \mathrm{~L}_{4}\right] \cdot\left(N T f_{2}\right)_{4}\left(\mathbf{1} / \mathbf{1}^{\prime}\right)$

$\left[\mathrm{Pd}\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{4}\right]\left(\mathrm{NTf}_{2}\right)_{2}$ and L were combined according to the general procedure without heating to afford a 4:1 mixture of the chiral and achiral forms ( 1 and $\mathbf{1}^{\prime}$ ) of $\left[\mathrm{Pd}_{2} \mathrm{~L}_{4}\right]^{4+}$ as a yellow solution. ${ }^{1} \mathrm{H} \mathrm{NMR}\left(500 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{CN}\right)$ 1: $\delta 9.41\left(\mathrm{~s}, 8 \mathrm{H}, \mathrm{H}_{\mathrm{i}}\right), 8.70\left(\mathrm{~d}, J=1.5 \mathrm{~Hz}, 8 \mathrm{H}, \mathrm{H}_{\mathrm{c}}\right), 7.76\left(\mathrm{~d}, J=6.4 \mathrm{~Hz}, 8 \mathrm{H}, \mathrm{H}_{\mathrm{h}}\right), 7.55-7.49\left(\mathrm{~m}, 16 \mathrm{H}, \mathrm{H}_{\mathrm{f}}, \mathrm{H}_{\mathrm{g}}\right)$, $7.40\left(\mathrm{dd}, J=8.4,7.3 \mathrm{~Hz}, 8 \mathrm{H}, \mathrm{He}_{\mathrm{e}}\right.$, $7.07\left(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 8 \mathrm{H}, \mathrm{Ha}_{\mathrm{a}}\right.$, $6.63(\mathrm{dd}, J=8.5,1.5 \mathrm{~Hz}, 8 \mathrm{H}, \mathrm{Hb}), 6.38(\mathrm{~d}, J=$ $\left.7.3 \mathrm{~Hz}, 8 \mathrm{H}, \mathrm{H}_{\mathrm{d}}\right), 4.59-4.24\left(\mathrm{~m}, 8 \mathrm{H}, \mathrm{N}-\mathrm{CH}_{2}\right), 2.09-2.02\left(\mathrm{~m}, 8 \mathrm{H}, \mathrm{CH}_{2}\right), 1.72-1.42\left(\mathrm{~m}, 24 \mathrm{H}, 3 \mathrm{xCH}_{2}\right)$, $0.99(\mathrm{t}, \mathrm{J}$ $\left.=7.3 \mathrm{~Hz}, 12 \mathrm{H}, \mathrm{CH}_{3}\right) ; 1^{\prime}: \delta 9.86\left(\mathrm{~s}, 8 \mathrm{H}, \mathrm{H}_{\mathrm{i}^{\prime}}\right), 8.75\left(\mathrm{~d}, J=6.6 \mathrm{~Hz}, 8 \mathrm{H}, \mathrm{H}_{h^{\prime}}\right), 8.33\left(\mathrm{~d}, J=7.0 \mathrm{~Hz}, 8 \mathrm{H}, \mathrm{H}_{\mathrm{d}^{\prime}}\right), 8.14(\mathrm{~d}$, $\left.J=8.2 \mathrm{~Hz}, 8 \mathrm{H}, \mathrm{Hf}^{\prime}\right), 8.12-8.05\left(\mathrm{~m}, 16 \mathrm{H}, \mathrm{H}_{\mathrm{e}^{\prime}}, \mathrm{H}_{\mathrm{g}^{\prime}}\right), 7.85\left(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 8 \mathrm{H}, \mathrm{Ha}^{\prime}\right), 7.31\left(\mathrm{~d}, J=1.5 \mathrm{~Hz}, 8 \mathrm{H}, \mathrm{H}_{\mathrm{c}^{\prime}}\right)$, $6.75\left(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 8 \mathrm{H}, \mathrm{H}_{b^{\prime}}\right), 4.88\left(\mathrm{t}, J=7.4 \mathrm{~Hz}, 8 \mathrm{H}, \mathrm{N}-\mathrm{CH}_{2}\right), 1.82-1.77\left(\mathrm{~m}, 8 \mathrm{H}, \mathrm{CH}_{2}\right), 0.73(\mathrm{t}, J=7.3 \mathrm{~Hz}, 12 \mathrm{H}$, $\mathrm{CH}_{3}$ ), other $\mathrm{CH}_{2}$ signals overlap with alkyl signals of 1 .

Figure S42. Partial ${ }^{1} \mathrm{H}$ NMR spectrum $\left(500 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{CN}\right)$ of a $4: 1$ mixture of the helicate $\left[\mathrm{Pd}_{2} \mathrm{~L}_{4}\right] \cdot\left(\mathrm{NTf}_{2}\right)_{4}(\mathbf{1})$ and mesocate $\left[\mathrm{Pd}_{2} \mathrm{~L}_{4}\right] \cdot\left(\mathrm{NTf}_{2}\right)_{4}$ (1').

Figure S43. ${ }^{19} \mathrm{~F}$ NMR spectrum ( $565 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{CN}$ ) of the mixture of $1 / 1$ '. $\delta-80.22$ (free $\mathrm{NTf}_{2}{ }^{-}$).

Figure S44. ESI-MS spectrum of the mixture of $1 / 1^{\prime}$. The spectrum shows peaks of $\left[\mathrm{Pd}_{2} \mathrm{~L}_{4}\right]\left(n \mathrm{NTf}_{2}\right)^{4-n+}(n=0-2)$ and the measured and calculated isotope pattern of $\left[\mathrm{Pd}_{2} \mathrm{~L}_{4}\right]^{4+}$ is also shown. Due to decomposition of the $\mathrm{NTf}_{2}$ anion, ${ }^{4}$ some peaks corresponding to $\left[\mathrm{Pd}_{2} \mathrm{~L}_{4}\right]\left(\mathrm{nCF}_{3} \mathrm{NO}_{4} \mathrm{~S}_{2}\right)^{4-n+}(\mathrm{n}=1,2)$ are present.

Figure S45. ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY spectrum $\left(600 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{CN}\right)$ of the $4: 1$ mixture of $\mathbf{1 / 1}$.

Figure S46. ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ NOESY spectrum $\left(600 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{CN}\right)$ of a $4: 1$ mixture of 1 and 1 '. The important NOE contacts of 1 ' are highlighted and shown in the image of the crystal structure in the inset.

### 1.3.9. Conversion of 1' to 1-PF6

Figure S47. ${ }^{1} \mathrm{H}$ NMR spectra ( $500 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{CN}$ ) of a) an equilibrated $1: 1$ mixture of helicate 1 (blue) and mesocate 1' (purple), obtained from the $\left[\mathrm{Pd}\left(\mathrm{CH}_{3} \mathrm{CN}\right)\right](\mathrm{NTf})_{2}$ salt; b) the same sample with $+48 \mu \mathrm{~L}$ (2 equivalents) of tetrabutylammonium hexafluorophosphate. The mixture was allowed to equilibrated over 24 h at room temperature. Red signals correspond to $\mathbf{1} \cdot \mathbf{P F}_{6}$, ratio of $\mathbf{1}^{\prime}$ to $\mathbf{1} \cdot \mathbf{P F}_{6}: 0.95: 1.0 \mathrm{c}$ ) the same sample heated at $70^{\circ} \mathrm{C}$ for 24 h . As can be observed from the above spectra, the pre-organised and helical form 1 readily binds the $\mathrm{PF}_{6}{ }^{-}$guest at room temperature, although the conversion of the extended cage 1 ' to $1 \cdot \mathrm{PF}_{6}$ requires additional energy (c).

Figure S48. ${ }^{1} \mathrm{H}$ NMR spectra $\left(500 \mathrm{MHz}\right.$, DMSO- $\left.\mathrm{d}_{6}\right)$ : a) $\mathbf{L}$; b) $2: 1$ mixture of $\left[\operatorname{Pd}\left(\mathrm{CH}_{3} \mathrm{CN}_{4}\right)_{4}\right]\left(\mathrm{BF}_{4}\right)_{2}$ and $\mathbf{L}$, heated at $70^{\circ} \mathrm{C}$ for 1.5 h .

Figure S49. ${ }^{1} \mathrm{H}$ NMR spectra ( 500 MHz , DMSO- $\mathrm{d}_{6}$ ): a) $2: 1$ mixture of $\left[\mathrm{Pd}\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{4}\right]\left(\mathrm{BF}_{4}\right)_{2}$ and $\mathbf{L}$, heated at $70^{\circ} \mathrm{C}$ for 1.5 h . Ratio of helicate to mesocate $=1: 0.45$; b) the same mixture after 24 h of heating at $70^{\circ} \mathrm{C}$. Ratio of helicate to mesocate $=1: 0.52$.
1.3.11. Temperature equilibrium between $1 \cdot B F_{4}$ and $1^{\prime}$ in $C D_{3} C N$

Figure $\mathbf{S 5 0}$. Variable temperature ${ }^{1} \mathrm{H}$ NMR spectra ( $500 \mathrm{MHz} / \mathrm{CD}_{3} \mathrm{CN}$ ) of $\mathbf{1} \cdot \mathrm{BF}_{4}$ (sample equilibrated over 3 months at room temperature). The peaks represented by the square (mesocate) and circle (helicate) were used calculate $K$.

Table 1.1 Calculated equilibrium between helicate $1 \cdot \mathrm{BF}_{4}$ and mesocate constant for various temperatures

| $\mathbf{T}(\mathbf{K})$ | $\mathbf{K}\left(\mathbf{M}^{-1}\right)$ | $\operatorname{InK}$ |
| :--- | :--- | :--- |
| 303.15 | 0.157031 | -1.85131 |
| 313.15 | 0.152555 | -1.88023 |
| 323.15 | 0.1467 | -1.91936 |
| 333.15 | 0.130725 | -2.03466 |

Figure S51. Van't hoff analysis of the equilibrium between helicate $\mathbf{1} \cdot \mathbf{B F}_{4}$ and mesocate $\mathbf{1}^{\prime}$. Standard errors of linear fit are given. The enthalpically driven isomerisation of the helicate may be driven by the relaxed ligand conformation and favourable edge-to-face $\pi$ interactions present in the mesocate isomer, as compared to the strained, helical conformation of the ligand in the helicate isomer. This is counterbalanced by the enthalpically driven encapsulation of the anion, which is the driving force for the helicate as the only detectable product for $\mathbf{1} \cdot \mathbf{X}\left(\mathrm{X}=\mathrm{ClO}_{4}{ }^{-}, \mathrm{PF}_{6}{ }^{-}, \mathrm{SbF}_{6}{ }^{-}, \mathrm{OTf} \mathrm{f}^{-}\right)$

## 2. ITC measurements

Table S3.1: Experiment and thermodynamic parameters of $1 \cdot \mathrm{NO}_{3}$ with $\mathrm{X}^{-}\left(\mathrm{X}=\mathrm{BF}_{4}^{-}, \mathrm{ClO}_{4}^{-}\right.$and $\left.\mathrm{PF}_{6}{ }^{-}\right)$measured by ITC

### 4.1. General details

$\mathbf{1} \cdot \mathrm{BF}_{4}, \mathbf{1} \cdot \mathrm{ClO}_{4}$ : A single crystal in mother liquor was pipetted onto a glass slide containing NVH oil. The crystal was quickly mounted onto a 0.2 mm nylon loop and measured on a Bruker D8 venture equipped with an Incoatec microfocus source (l $\mu \mathrm{s}$ 2.0) using $\mathrm{Cuk}_{\alpha}$ radiation.
$\mathbf{1}^{\prime}, \mathbf{1} \cdot \mathrm{PF}_{6}, \mathbf{1} \cdot \mathrm{SbF}_{6}, \mathbf{1} \cdot \mathrm{OTf}$ : A single crystal in mother liquor was pipetted onto a glass slide, mounted onto a 0.2 mm or 0.3 mm loop and placed in UNI Pucks at cryogenic temperatures. The UNI Pucks were placed in a dry shipper which enabled safe transportation to the macromolecular beamline P115 at Petra III, DESY, Germany. UNI Pucks were transferred to the sample dewar and all samples were mounted using the StäubliTX60L robotic arm. A wavelength of 0.6889 Å was chosen using a liquid $N_{2}$ cooled double crystal monochromator. Single crystal X-ray diffraction data was collected at $80(2) \mathrm{K}$ on a single axis goniometer, equipped with an Oxford Cryostream 800 a Pilatus 6M fast.

The structures were solved by intrinsic phasing/direct methods using SHELXT ${ }^{6}$ and refined with SHELXL ${ }^{7}$ using 22 cpu cores for full-matrix least-squares routines on $F^{2}$ and ShelXle ${ }^{8}$ as a graphical user interface and the DSR program plugin was employed for modelling. ${ }^{9}$

Stereochemical restraints for the CHQ ligands, solvent molecules and counter ions of the structure were generated by the GRADE program using the GRADE Web Server (http://grade.globalphasing.org) and applied in the refinement. A GRADE dictionary for SHELXL contains target values and standard deviations for 1,2distances (DFIX) and 1,3-distances (DANG), as well as restraints for planar groups (FLAT). All displacements
for non-hydrogen atoms were refined anisotropically. The refinement of ADP's for carbon, nitrogen and oxygen atoms was enabled by a combination of similarity restraints (SIMU) and rigid bond restraints (RIGU). ${ }^{10}$ The contribution of the electron density from disordered counterions and solvent molecules, which could not be modelled with discrete atomic positions were handled using the SQUEEZE ${ }^{11}$ routine in PLATON ${ }^{12}$. The solvent mask file (.fab) computed by PLATON were included in the SHELXL refinement via the ABIN instruction leaving the measured intensities untouched.

### 4.2. Specific details

### 4.2.1. Specific details on 1'

This structure was treated with SQUEEZE protocol inside PLATON because the crystal lattice contains large voids filled with scattered electron density derived from the disordered solvent molecules. One hexyl chain on the CHQ ligand was solved as a conformational disordered model at two positions, whose occupancies were 0.62 and 0.38 , respectively. Three $\mathrm{NO}_{3}$ anions were located at special positions, whose occupancies were treated as 0.5.

| Ligand | Residue class | Occurrence | Residue numbers |
| :--- | :--- | :--- | :--- |
| $\mathrm{Pd}^{2+}$ | PD | 2 | 9 |
| CHQ | CHQ | 4 | 1,2 |
| Acetonitrile | ACN | 2 | 3 |
| $\mathrm{NO}_{3}{ }^{-}$ | NO 3 | 5 | $4-8$ |

### 4.2.2. Specific details on $\mathbf{1} \cdot \mathrm{BF}_{4}$

This structure was refined as two component twin using BASF/TWIN instructions, resulting in the BASF parameter of $\sim 30 \%$ and a Flack parameter of $0.0222(18)$. The $\mathrm{BF}_{4}$ anion trapped within the helical cage was disordered with three conformations which were refined isotropically and their occupancies were refined using SUMP instruction. Two hexyl chains on the CHQ ligands were solved as conformational disordered models at two positions.

| Ligand | Residue class | Occurrence | Residue numbers |
| :--- | :--- | :--- | :--- |
| $\mathrm{Pd}^{2+}$ | PD | 2 | 12 |
| $\mathrm{CHQ}^{\mathrm{H}}$ | CHQ | 4 | $1,2,3,4$ |
| $\mathrm{BF}_{4}-$ | BF 4 | 4 | $5-11$ |

### 4.2.3. Specific details on $\mathbf{1} \cdot \mathrm{ClO}_{4}$

This structure was refined as two component twin using BASF/TWIN instructions, resulting in the BASF parameter of $\sim 25 \%$ and a Flack parameter of $-0.013(4)$. The $\mathrm{ClO}_{4}$ anion trapped within the helical cage was disordered with two conformations whose occupancies were 0.63 and 0.37 , respectively. Owing to the poor scattering power of the crystal, all of the counter anions were not refined. Some $\mathrm{NO}_{3}$ anions could be refined, which were consistent with ESI-MS analysis (Figure S18).

| Ligand | Residue class | Occurrence | Residue numbers |
| :--- | :--- | :--- | :--- |
| $\mathrm{Pd}^{2+}$ | PD | 2 | 11 |
| CHQ | CHQ | 4 | $1,2,3,4$ |
| Acetonitrile | ACN | 0.5 | 10 |
| $\mathrm{CIO}_{4}^{-}$ | CLO | 2.5 | $5,6,7$ |
| $\mathrm{NO}_{3}{ }^{-}$ | NO 3 | 1 | 8,9 |

### 4.2.4. Specific details on $1 \cdot P F_{6}$

This structure was treated with SQUEEZE protocol inside PLATON because the crystal lattice contains large voids filled with scattered electron density derived from the disordered solvent molecules. The $\mathrm{PF}_{6}$ anion trapped within the helical cage was disordered with two conformations whose occupancies were 0.48 and 0.52 , respectively. One $\mathrm{PF}_{6}$ anion located at the outside of the cage was treated as a disordered model.

| Ligand | Residue class | Occurrence | Residue numbers |
| :--- | :--- | :--- | :--- |
| $\mathrm{Pd}^{2+}$ | PD | 2 | 12 |
| $\mathrm{CHQ}^{\mathrm{PH}}$ | CHQ | 4 | $1,2,3,4$ |
| $\mathrm{PF}_{6}$ | PF 6 | 4 | $5-10$ |
| Diisopropylether | DIP | 1 | 11 |

### 4.2.5. Specific details on $\mathbf{1} \cdot \mathrm{ReO}_{4}$

This structure was treated with SQUEEZE protocol inside PLATON because the crystal lattice contains large voids filled with scattered electron density derived from the disordered solvent molecules. This structure was also refined as two component twin using BASF/TWIN instructions, resulting in the BASF parameter of $\sim 43 \%$ and a Flack parameter of $-0.002(3)$. The $\mathrm{ReO}_{4}$ anion trapped within the helical cage was disordered with two conformations whose occupancies were 0.53 and 0.47 , respectively. Owing to the poor scattering power of the crystal, all of the counter anions were not refined. One $\mathrm{NO}_{3}$ anion could be observed in this refinement, which was consistent with ESI-MS measurement (Figure S41).

| Ligand | Residue class | Occurrence | Residue numbers |
| :--- | :--- | :--- | :--- |
| $\mathrm{Pd}^{2+}$ | PD | 2 | 13 |
| CHQ | CHQ | 4 | $1,2,3,4$ |
| $\mathrm{ReO}_{4}^{-}$ | REO 4 | 2 | $5,6,7$ |
| $\mathrm{NO}_{3}-$ | NO 3 | 1 | 9 |

### 4.2.6. Specific details on $\mathbf{1} \cdot \mathrm{SbF}_{6}$

This structure was treated with SQUEEZE protocol inside PLATON because the crystal lattice contains large voids filled with scattered electron density derived from the disordered solvent molecules. The $\mathrm{SbF}_{6}$ anion trapped within the helical cage was disordered with two conformations whose occupancies were 0.57 and 0.43 , respectively. Two $\mathrm{PF}_{6}$ anions located at the outside of the cage were disordered at two positions. Two hexyl chains on the CHQ ligands were solved as conformational disordered models.

| Ligand | Residue class | Occurrence | Residue numbers |
| :--- | :--- | :--- | :--- |
| $\mathrm{Pd}^{2+}$ | PD | 2 | 19 |
| $\mathrm{CHQ}^{\text {SbF }}{ }^{-}$ | CHQ | 4 | $1,2,3,4$ |
| Diisopropylether | SBF | 4 | $5-11$ |

### 4.2.7. Specific details on $\mathbf{1} \cdot \mathbf{O T f}$

This structure was treated with SQUEEZE protocol inside PLATON because the crystal lattice contains large voids filled with scattered electron density derived from the disordered solvent molecules. The OTf anion trapped within the helical cage was disordered with two conformations whose occupancies were 0.63 and 0.37 , respectively. The occupancy of one OTf anion located at the outside of the cage was refined as 0.5 due to its extremely high flexibility. Two hexyl chains on the CHQ ligands were solved as conformational disordered models.

| Ligand | Residue class | Occurrence | Residue numbers |
| :--- | :--- | :--- | :--- |
| $\mathrm{Pd}^{2+}$ | PD | 2 | 16 |
| CHQ $^{\text {OTf }}$ | CHQ | 4 | $1,2,3,4$ |
| Diisopropylether | TFA | 3.5 | $5-9$ |

### 4.3. Thermal ellipsoid plots

${ }^{\text {a }}$ Calculated by DFT geometry optimization (R3BLYP; B, O, F, CI, P, S: 6-31g(d); Re, Sb: LANL2DZ)
${ }^{\text {b }}$ Calculated using VOIDOO (1.4 Å probe radius)
${ }^{c}$ Averaged value of plane angles between N4-Pd1-Pd2 and N31-Pd2-Pd1 planes determined by the MPLA command in SHELXL-2014/7. The same values can be obtained by measuring and averaging torsion angles of N4-Pd1-Pd2-N31.

Figure S61. A graph showing the relationship between the anion volume and the cavity volume of $\mathbf{1} \cdot \mathbf{X}$. The data plotted was obtained from the X-ray crystal structures.

## 5. Ion-Mobility Mass Spectrometry

Ion mobility measurements were performed on a Bruker timesTOF instrument combining a trapped ion mobility (TIMS) with a time-of-flight (TOF) mass spectrometer in one instrument. In contrast to the conventional drift tube method to determine mobility data, where ions are carried by an electric field through a stationary drift gas, the TIMS method is based on an electric field ramp to hold ions in place against a carrier gas pushing them in the direction of the analyzer. Consequently, larger sized ions that experience more carrier gas impacts leave the TIMS units first and smaller ions elute later. This method offers a much higher mobility resolution despite a smaller device size.

### 5.1. Sample preparation

$\mathbf{1} \cdot \mathrm{NO}_{3}, \mathbf{1} \cdot \mathrm{BF}_{4}, \mathbf{1} \cdot \mathrm{ClO}_{4}, \mathbf{1} \cdot \mathrm{SbF}_{6}, \mathbf{1} \cdot \mathrm{OTf}, \mathbf{1} \cdot \mathrm{NTf}_{2}(\mathbf{1} / 1$ '): The measurement samples ( $10 \mu \mathrm{M} \mathrm{CH} 3$ CN solution) were prepared by dilution of $\left[\mathrm{Pd}_{2} \mathrm{~L}_{4}\right](\mathrm{X})_{4}$ solutions $(2.2 \mathrm{mM})$ obtained according to the general procedure.
$\mathbf{1} \cdot \mathbf{R e O}_{4}, \mathbf{1} \cdot \mathrm{PF}_{6}$ : The measurement samples ( $10 \mu \mathrm{M} \mathrm{CH} 3{ }_{3} \mathrm{CN}$ solution) were prepared by a dilution of mixtures of $\left[\mathrm{Pd}_{2} \mathrm{~L}_{4}\right]\left(\mathrm{NO}_{3}\right)_{4}(2.2 \mathrm{mM})$ and tetrabutyl ammounim salts $\left(\left[{ }^{[ } \mathrm{Bu}_{4} \mathrm{~N}\right]\left[\mathrm{ReO}_{4}\right]\right.$ or $\left.\left[{ }^{n} \mathrm{Bu}_{4} \mathrm{~N}\right]\left[\mathrm{PF}_{6}\right]\right)(8.8 \mathrm{mM})$.

### 5.2. Measurement conditions

After the generation of ions by electrospray ionisation (ESI, sample concentration: $10 \mu \mathrm{M}$, solvent $\mathrm{CH}_{3} \mathrm{CN}$, capillary voltage: 3600 V , end plate offset voltage: 500 V , nebulizer gas pressure: 0.3 bar, dry gas flow rate: $3.5 \mathrm{l} / \mathrm{min}$, dry temperature $200{ }^{\circ} \mathrm{C}$ ) the desired ions were orthogonally deflected into the TIMS cell consisting of an entrance funnel, the TIMS analyser (carrier gas: N2, temperature: 305 K , entrance pressure: 2.55 mbar, exit pressure: 0.89 mbar, IMS imeX ramp end $1.881 / \mathrm{KO}$, IMS imeX ramp start: $0.771 / \mathrm{KO}$ ). As a result, the ions are stationary trapped. After accumulation (accumulation time: 5 ms ), a stepwise reduction of the electric field strength leads to a release of ion packages separated by their mobility. After a subsequent focussing, the separated ions are transferred to the TOF-analyser. ${ }^{13-15}$ For calibration of both the TIMS and TOF analysers, commercially available Agilent ESI tuning mix was used. The instrument was calibrated before each measurement, including each change in the ion mobility resolution mode ("imeX" settings: survey, detect or ultra).

### 5.3. Ion-Mobility data of $\left[\left(\mathrm{Pd}_{2} \mathrm{~L}_{4}\right)(\mathrm{X})\right]^{3+}$ and $\left[\left(\mathrm{Pd}_{2} \mathrm{~L}_{4}\right)\left(\mathrm{X}_{2}\right)\right]^{2+}$

5.3.1. Ion-Mobility spectra of $1 \cdot \mathrm{NO}_{3}:\left[\left(\mathrm{Pd}_{2} \mathrm{~L}_{4}\right)\left(\mathrm{NO}_{3}\right)\right]^{3+}$ and $\left[\left(\mathrm{Pd}_{2} \mathrm{~L}_{4}\right)\left(\mathrm{NO}_{3}\right)_{2}\right]^{2+}$.

Figure S62. Extracted ion mobilograms of (a) $\left[\left(\mathrm{Pd}_{2} \mathrm{~L}_{4}\right)\left(\mathrm{NO}_{3}\right)\right]^{3+}$ at $\mathrm{m} / \mathrm{z} 829.6$ and $(\mathrm{b})\left[\left(\mathrm{Pd}_{2} \mathrm{~L}_{4}\right)\left(\mathrm{NO}_{3}\right)_{2}\right]^{2+}$ at $\mathrm{m} / \mathrm{z}$ 1275.4.
5.3.2. Ion-Mobility spectra of 1-BF4: $\left[\left(\mathrm{Pd}_{2} \boldsymbol{L}_{4}\right)\left(B F_{4}\right)\right]^{3+}$ and $\left[\left(\mathrm{Pd}_{2} \boldsymbol{L}_{4}\right)\left(B F_{4}\right)_{2}\right]^{2+}$.

Figure S63. Extracted ion mobilograms of $(\mathrm{a})\left[\left(\mathrm{Pd}_{2} \mathrm{~L}_{4}\right)\left(\mathrm{BF}_{4}\right)\right]^{3+}$ at $\mathrm{m} / \mathrm{z} 837.9$ and $(\mathrm{b})\left[\left(\mathrm{Pd}_{2} \mathrm{~L}_{4}\right)\left(\mathrm{BF}_{4}\right)_{2}\right]^{2+}$ at $\mathrm{m} / \mathrm{z} 1300.4$.
5.3.3. Ion-Mobility spectra of 1.ClO $4:\left[\left(\mathrm{Pd}_{2} \boldsymbol{L}_{4}\right)\left(\mathrm{ClO}_{4}\right)\right]^{3+}$ and $\left[\left(\mathrm{Pd}_{2} \mathrm{~L}_{4}\right)\left(\mathrm{ClO}_{4}\right)_{2}\right]^{2+}$.

Figure S64. Extracted ion mobilograms of $(a)\left[\left(\mathrm{Pd}_{2} \mathrm{~L}_{4}\right)\left(\mathrm{ClO}_{4}\right)\right]^{3+}$ at $\mathrm{m} / \mathrm{z} 842.3$ and $(\mathrm{b})\left[\left(\mathrm{Pd}_{2} \mathrm{~L}_{4}\right)\left(\mathrm{ClO}_{4}\right)_{2}\right]^{2+}$ at $\mathrm{m} / \mathrm{z} 1313.4$.
5.3.4. Ion-Mobility spectra of 1-ReO4: $\left[\left(\mathrm{Pd}_{2} \mathrm{~L}_{4}\right)\left(\mathrm{ReO}_{4}\right)\right]^{3+}$ and $\left[\left(\mathrm{Pd}_{2} \mathrm{~L}_{4}\right)\left(\mathrm{ReO}_{4}\right)_{2}\right]^{2+}$.
a)

b)

Figure S65. Extracted ion mobilograms of $(\mathrm{a})\left[\left(\mathrm{Pd}_{2} \mathrm{~L}_{4}\right)\left(\mathrm{ReO}_{4}\right)\right]^{3+}$ at $m / z 892.6$ and $(\mathrm{b})\left[\left(\mathrm{Pd}_{2} \mathrm{~L}_{4}\right)\left(\mathrm{ReO}_{4}\right)_{2}\right]^{2+}$ at $m / z$ 1463.4.
5.3.5. Ion-Mobility spectra of 1.PF $:\left[\left(P d_{2} L_{4}\right)\left(P F_{6}\right)\right]^{3+}$ and $\left[\left(P d_{2} L_{4}\right)\left(P F_{6}\right)_{2}\right]^{2+}$.

Figure S66. Extracted ion mobilograms of (a) $\left[\left(\mathrm{Pd}_{2} \mathrm{~L}_{4}\right)\left(\mathrm{PF}_{6}\right)\right]^{3+}$ at $\mathrm{m} / \mathrm{z} 857.3$ and $(\mathrm{b})\left[\left(\mathrm{Pd}_{2} \mathrm{~L}_{4}\right)\left(\mathrm{PF}_{6}\right)_{2}\right]^{2+}$ at $m / z$ 1358.4.
5.3.6. Ion-Mobility spectra of $\mathbf{1} \cdot \mathbf{S b F}_{6}:\left[\left(\mathrm{Pd}_{2} \mathbf{L}_{4}\right)\left(\mathrm{SbF}_{6}\right)\right]^{3+}$ and $\left[\left(\mathrm{Pd}_{2} \mathrm{~L}_{4}\right)\left(\mathrm{SbF}_{6}\right)_{2}\right]^{2+}$.
a)

${ }^{a}$ Measured at 305 K in $\mathrm{N}_{2}$ drift gas. ${ }^{b, c}$ Obtained from the X-ray crystal structures deduced computationally using the trajectory (TJ) method of the N2_MOBCAL program (b) without and (c) with partial charges on each atom. The partial charges were obtained single-point calculations with DFT method using B3LYP function. LanL2DZ and $6-31 \mathrm{G}(\mathrm{d}, \mathrm{p})$ were employed to treat Pd , Re, Sb and other atoms, respectively. The numbers in parentheses are the corresponding standard deviations.

We also examined the $2+$ species $\left(1 \cdot \mathbf{X}_{2}\right)$ to investigate the effect that the additional, non-encapsulated anion has on their size. CCS calculations revealed that the 2+ species gradually become larger as the size of the anion increases. This trend explains the structural preferences of $1 \cdot \mathbf{X}_{2}$, whose two anions are located inside the helical cage and above the $\mathrm{Pd}(\mathrm{II})$ plane, respectively, as determined in X-ray crystal structures. It is evident that the differences in CCS values for $2+$ species are not significantly large, and are presumably masked by the flexible N -hexyl chains of the ligand and subtle structural difference of $\mathbf{1 \cdot X}$ (e.g. Pd…Pd distance).

### 5.3.7. Ion-Mobility spectrum of $\left(\mathrm{Pd}_{2} \mathrm{~L}_{4}\right)\left(N T f_{2}\right)_{4}\left(\mathbf{1} / \mathbf{1}^{\prime}\right)$.

Figure S69. Extracted ion mobilogram of $\left[\mathrm{Pd}_{2} \mathbf{L}_{4}\right]^{4+}$ at $\mathrm{m} / \mathrm{z}$ 606.7. A manual peak separation for two major components was carried out by curve fitting the spectrum using the Fityk software (M. Wojdyr, J. Appl. Cryst. 2010, 43, 1126-1128). Shown are the experimental ionmobility spectrum (black), simulated peak 1 (blue), simulated peak 2 (green), and sum of simulated peaks (red dash).

The partial charges were obtained single-point calculations with DFT method using B3LYP function. LanL2DZ and 6-31G(d,p) were employed to treat Pd and other atoms, respectively. The numbers in parentheses are the corresponding standard deviations.

Figure S70. A graph showing the relationship between the anion volume and the collision cross sections (CCS) of $\left[\mathrm{X} @ \mathrm{Pd}_{2} \mathrm{~L}_{4}\right]^{3+}$ and $\left[\left(X @ P_{2} L_{4}\right) X\right]^{2+}$.

## 6. Electronic Structure Calculations

The host and combined host-guest geometries were optimized with RI-BP86, ${ }^{16,17}$ the def2-SVP18,19 orbital basis and the corresponding J -basis ${ }^{20}$ using the TURBOMOLE package. ${ }^{21}$ For the Pd atoms the ECP-28MWB pseudopotential ${ }^{12}$ was used. The host and host-guest structures were taken from X-ray crystallography results. To lower the number of atoms and make the systems computationally more feasible the outer hexyl-groups were removed and carbazole nitrogens capped with methyl-groups. For the obtained minimum structures single point DF ${ }^{23}$-SCS ${ }^{24}-\mathrm{LMP} 2^{25,26}$ calculations were performed. The Dunning cc-pVTZ ${ }^{27}$ orbital basis set was used in combination with the cc-pVTZ-PP ${ }^{28}$ basis and the ECP28MDF ${ }^{29}$ pseudopotential for Pd as well as the ECP60MDF ${ }^{29}$ for Re (this basis will be referred to as VTZ). The density fitting basis used were the corresponding defaults (for the cc-pVTZ ${ }^{30,31}$ ) except for calculations with Pd and Re, where the JKFIT and MP2FIT def2-TZVPP ${ }^{32,33}$ basis sets were used. The orbitals were localized by the Pipek-Mezey scheme. ${ }^{34}$ The corresponding orbital domains were determined with a Boughton-Pulay criterion ${ }^{35}$ at a threshold of 0.985 . To speed up the calculations we made use of the multipole-approximiation ${ }^{36}$ for very-distant pairs ( $r=10$ Bohr) and local fitting. ${ }^{23}$ All calculations were carried out with a development version of Molpro2018.1. ${ }^{37}$ According to the locality of the orbitals we were able to build fragments (guest plus host) to determine the dispersion contributions ${ }^{38,39}$ at the SCS-LMP2/VTZ level of theory, stabilizing the guest molecules. ${ }^{40,41}$

Table S5.3: Calculated structural parameters of $\mathbf{1 \cdot X}$ and corresponding dispersion contributions.

|  | Solid-state |  | Gas-phase |  |
| :---: | :---: | :---: | :---: | :---: |
| Sample | $\text { Pd } \cdots \text { Pd }$ distance (Å) | $\Delta$ Edisp kcal/mol | $\text { Pd } \cdots \text { Pd }$ distance (Å) | $\Delta$ Edisp kcal/mol |
| 1. $\mathrm{BF}_{4}$ | 9.287 | -10.77 | 7.911 | -12.19 |
| 1. $\mathrm{ClO}_{4}$ | 9.040 | -19.52 | 7.902 | -24.07 |
| 1. $\mathrm{ReO}_{4}$ | 8.990 | -31.35 | 8.038 | -37.06 |
| 1. $\mathrm{PF}_{6}$ | 8.713 | --- | 8.066 | --- |
| 1. $\mathrm{SbF}_{6}$ | 8.805 | --- | 8.280 | --- |
| 1.0Tf | 9.400 | --- | 8.880 | --- |

Note: The values for dispersion in the case of $\mathrm{PF}_{6}, \mathrm{SbF}_{6}$ and OTf were not included due to difficulties in separating the orbital fragments.

Figure S71. A VOXEL-DID structural representation of a) $1 \cdot \mathbf{B F}_{4}$ gas-phase structure (b) $\mathbf{1} \cdot \mathrm{BF}_{4}$ solid-state structure.

Figure S72. A VOXEL-DID structural representation of a) $\mathbf{1} \cdot \mathbf{R e O}_{4}$ gas-phase structure (b) $\mathbf{1} \cdot \mathbf{R e O} \mathbf{H}_{4}$ solid-state structure.

In order to investigate the experimental differences between gas-phase and solid-state, the host-guest systems were first optimized in a set of calculations with fixed Pd-Pd distances. This was followed by another series of completely relaxed structures. The DFT geometries achieved by the latter show a systematic shortening of the Pd-Pd distance. Thereby, the results reflect the calculated CCS-values for the host-guest systems, whereby guests with the same volume tend to form the same host geometry.

Figure S73. Results of a surface scan along the Pd-Pd axis performed for the empty cage. Thereby, the X-Ray host-structure of 1•PF6 served as the starting guess and the Pd-Pd distance was gradually increased by 0.2 Bohr and optimized. The resulting structures were recalculated at the DF-SCS-LMP2/VTZ level of theory. The revealed SCS-LMP2 minimum has a Pd-Pd distance of $9.7 \AA$, a larger value than all measured host-guest complexes, implying that the binding of the anion leads to an increased folding.

[^0]:    ${ }^{a}$ Anions (as their tetrabutylammonium salts) were titrated into a freshly prepared solution of $\mathbf{1} \cdot \mathbf{N O}_{3}$ in $\mathrm{CH}_{3} \mathrm{CN}$. Note: the reference cell contained $\mathrm{CH}_{3} \mathrm{CN}$ (HPLC grade).
