## 1. Materials and Synthesis

All chemicals and solvents were reagent grades and purchased from Alfa Aesar, Macklin, Aldrich and TCI Chemical, respectively. Compound 1 was synthesized according to the procedure reported in the literature. ${ }^{1}$ Compound 2 was purchased from HYRER. M2 and M3 were purchased from Solarmer. PM6 was synthesized according to the reported method. ${ }^{2}$ The synthetic route of polymers is shown in Scheme 1 and the detailed synthesis processes are described as follows:

## Synthesis of M1 (Y5-C20-Br)

Compound 1 ( $682 \mathrm{mg}, 0.50 \mathrm{mmol}$ ) brominated 1,1-dicyanomethylene-3indanone ( $\mathbf{I C}-\mathbf{B r}, 410 \mathrm{mg}, 1.50 \mathrm{mmol}$ ), pyridine $(950 \mu \mathrm{~L})$, and chloroform ( 45 mL ) were mixed in two-necked flask with argon protection. The mixture was stirred at 65 ${ }^{\circ} \mathrm{C}$ for 5 h . The resulted solution was poured into methanol and filtered to obtain the crude product, which was then purified using column chromatography on silica gel with dichloromethane/petroleum ether $(1 / 2, \mathrm{v} / \mathrm{v})$ as the eluent to give the blue-black solid Y5-C20-Br ( $769 \mathrm{mg}, 82 \%$ yield). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\mathrm{ppm} \delta 9.18$ (d, $J=1.7$ $\mathrm{Hz}, 2 \mathrm{H}), 8.85(\mathrm{~d}, J=1.5 \mathrm{~Hz}, 1 \mathrm{H}), 8.57(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 1 \mathrm{H}), 8.03(\mathrm{~d}, J=1.9 \mathrm{~Hz}, 1 \mathrm{H})$, 7.87 (ddd, $J=8.4,4.2,1.7 \mathrm{~Hz}, 2 \mathrm{H}), 7.79(\mathrm{dd}, J=7.9,1.0 \mathrm{~Hz}, 1 \mathrm{H}), 4.76$ (d, $J=7.7 \mathrm{~Hz}$, 4H), 3.23 (t, $J=7.9 \mathrm{~Hz}, 4 \mathrm{H}), 2.12(\mathrm{~s}, 2 \mathrm{H}), 1.88(\mathrm{p}, J=7.9 \mathrm{~Hz}, 4 \mathrm{H}), 1.42-0.72(\mathrm{~m}$, $114 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 187.3,186.9,159.9,159.4,153.6,147.5,145.1$, $141.4,138.5,138.3,137.7,137.7,137.2,135.9,135.6,135.5,135.5,134.3,134.1$, 134.1, 134.1, 133.50, 133.5, 130.7, 130.1, 129.4, 128.2, 126.7, 126.4, 124.5, 120.2, $120.4,115.2,115.1,114.9,114.9,114.5,113.5,113.5,99.9,99.7,68.4,68.1,55.6,39.1$, $31.9,31.9,31.8,31.8,31.5,30.5,29.9,29.8,29.8,29.7,29.6,29.6,29.5,29.4,29.4$, 29.4, 29.3, 29.3, 29.2, 29.2, 25.5, 22.7, 22.6, 22.6, 14.1. $\mathrm{C}_{106} \mathrm{H}_{136} \mathrm{Br}_{2} \mathrm{~N}_{8} \mathrm{O}_{2} \mathrm{~S}_{5}$ $\left[\mathrm{M}^{+} \mathrm{H}\right]^{+}: 1873.78$. Found: 1871.99.

## Synthesis of PYT

M1, (Y5-C20-Br, $80 \mathrm{mg}, 0.0428 \mathrm{mmol}$ ), M2, (2,5-bis(trimethylstannyl)thiophene, $17.6 \mathrm{mg}, 0.0428 \mathrm{mmol}), \mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}(4 \mathrm{mg})$ were combined in a 25 mL sealed tube. Dry toluene (Tol) ( 10 mL ) was added under the argon atmosphere. The mixture was stirred
at $110{ }^{\circ} \mathrm{C}$ for 48 h . After cooled down to room temperature, the reactant mixture was poured into $\mathrm{MeOH}(50 \mathrm{~mL})$. The precipitate was filtered and the obtained solid was chromatographically purified on a silica gel column eluted with chloroform to remove the impurities and oligomers. The remaining polymer was precipitated into methanol. The solid was filtered and dried under a vacuum to give the dark solid. PYT ( 50 mg , $50 \%$ yield).

## Synthesis of PY-DF

M1, (Y5-C20-Br, $80 \mathrm{mg}, 0.0428 \mathrm{mmol})$, M3, (2,5-bis(trimethylstannyl)thiophene, $19.1 \mathrm{mg}, 0.0428 \mathrm{mmol}), \mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}(5.2 \mathrm{mg})$ were combined in a 25 mL sealed tube. Dry toluene (Tol) (10 mL) was added under the argon atmosphere. The mixture was stirred at $110^{\circ} \mathrm{C}$ for 72 h . After cooled down to room temperature, the reactant mixture was poured into $\mathrm{MeOH}(50 \mathrm{~mL})$. The precipitate was filtered and the obtained solid was chromatographically purified on a silica gel column eluted with chloroform to remove the impurities and oligomers. The remaining polymer was precipitated into methanol. The solid was filtered and dried under a vacuum to give the dark solid. PYDF (53 mg, 51\% yield).

## 2. Instruments and Measurements

### 2.1 GPC, TGA, UV-Vis-NIR absorption, CV, and PL measurements

Molecular weight of the polymers was measured by high temperature gel permeation chromatography (GPC) on an Agilent PL-GPC 220 instrument with 1,2,4 trichlorobenzene as the eluent and polystyrene as the standard at $160{ }^{\circ} \mathrm{C}$. Thermogravimetric analysis (TGA) was obtained on a Perkin-Elmer TGA-7. UV-vis
absorption spectra were recorded on an Agilent Technologies Cary Series UV-Vis-NIR Spectrophotometer. The electrochemical cyclic voltammetry (CV) measurements were carried out on a Donghua DH7000 Electrochemical Workstation with glassy carbon disk, Pt wire, and $\mathrm{Ag} / \mathrm{Ag}^{+}$electrode as working electrode, counter electrode, and reference electrode respectively, in a 0.1 M tetrabutylammonium hexafluorophosphate $\left(\mathrm{Bu}_{4} \mathrm{NPF}_{6}\right)$ acetonitrile solution. Photoluminescence (PL) spectra were carried out on an Edinburgh Instrument FLS 980 spectrofluorometer.

### 2.2 J-V and EQE measurement

The current density-voltage $(J-V)$ characteristics of the all-PSCs were recorded with a keithley 2450 . The power conversion efficiencies were measured under 1 sun, AM 1.5 G (air mass 1.5 global) ( $100 \mathrm{~mW} \mathrm{~cm}{ }^{-2}$ ) using a SS-F53A (Enli Technology CO., Ltd.) solar simulator (AAA grade, $50 \mathrm{~mm} \times 50 \mathrm{~mm}$ photo-beam size). $2 \times 2 \mathrm{~cm}^{2}$ Monocrystalline silicon reference cell (SRC-00019, covered with a KG5 filter windows) was purchased from Enli Technology CO., Ltd. The EQE was measured by Solar Cell Spectral Response Measurement System QE-R3011 (Enli Technology CO., Ltd.). The light intensity at each wavelength was calibrated with a standard singlecrystal Si photovoltaic cell.

### 2.3 Mobility measurement

The hole and electron mobilities were calculated by using the space-charge-limited current (SCLC) method. The corresponding charge mobilities were calculated from fitting the Mott-Gurney square law:

$$
J=\frac{9 \varepsilon 0 \varepsilon \mathrm{r} \mu(V \mathrm{appl}-V \mathrm{bi}-V \mathrm{~s}) 2}{8 L 3}
$$

Where $J$ is the current density, $\varepsilon_{0}$ is the permittivity for free space, $\varepsilon_{\mathrm{r}}$ is the relative permittivity of the active layer (assumed to be 3 ), $\mu$ is the hole or electron mobility, $V_{\text {appl }}$ is the applied voltage, $V_{\mathrm{bi}}$ is the built-in voltage $(0 \mathrm{~V}), V_{\mathrm{s}}$ is the voltage drop from the substrate's series resistance $\left(V_{\mathrm{s}}=\mathrm{I} \times \mathrm{R}\right)$ and L is the thickness of the active layer.

### 2.4 Energy loss measurement

FTPS-EQE was measured by using an integrated system (PECT-600, Enlitech), where the photocurrent was amplified and modulated by a lock-in instrument. $\mathrm{EQE}_{\mathrm{EL}}$ measurement was performed by applying external voltage/current sources through the devices (ELCT-3010, Enlitech).
$E_{\text {loss }}=E_{\mathrm{g}}^{\mathrm{PV}}-q V_{\mathrm{oc}}$
$=\left(E_{\mathrm{g}}^{\mathrm{PV}}-q V_{\mathrm{oc}}^{\mathrm{SQ}}\right)+\left(q V_{\mathrm{oc}}^{\mathrm{SQ}}-q V_{\mathrm{oc}}^{\mathrm{rad}}\right)+\left(q V_{\mathrm{oc}}^{\mathrm{rad}}-q V_{\mathrm{oc}}\right)$
$=\left(E_{\mathrm{g}}^{\mathrm{PV}}-q V_{\text {oc }}^{\mathrm{SQ}}\right)+q \Delta V_{\text {oc }}^{\text {rad, below gap }}+q \Delta V_{\text {oc }}^{\text {non - rad }}$
$=\Delta E_{1}+\Delta E_{2}+\Delta E_{3}$
Where $V$ SQ ocis the maximum voltage according to the Shockley-Queisser limit, Vrad ocis the open-circuit voltage when there is only radiative recombination.
$q V_{\mathrm{oc}}^{\mathrm{SQ}}=k T \operatorname{Ln}\left(\frac{J_{\mathrm{SC}, \mathrm{SQ}}}{J_{0, \mathrm{SQ}}}+1\right)=k T \mathrm{Ln}\left(\frac{\mathrm{e} \int_{\mathrm{E}_{\mathrm{g}}}^{\infty} \emptyset_{\mathrm{AM} 1.5}(\mathrm{E}) \mathrm{dE}}{\mathrm{e} \int_{\mathrm{E}_{\mathrm{g}}}^{\infty} \emptyset_{\mathrm{bb}}(\mathrm{E}) \mathrm{dE}}+1\right)$
where $\varnothing_{\text {AM1.5 }}$ is the solar radiation photon flux, $\varnothing_{\mathrm{bb}}$ is the black body radiation at 300 K .
$q V_{\mathrm{oc}}^{\mathrm{rad}}=\mathrm{kTLn}\left(\frac{J_{\mathrm{sc}}}{J_{0, \mathrm{rad}}}+1\right)=\mathrm{kTLn}\left(\frac{q \int_{0}^{\infty} \mathrm{EQE} \emptyset_{\mathrm{AM} 1.5}(E) \mathrm{d} E}{q \int_{0}^{\infty} \mathrm{EQE} \emptyset_{\mathrm{bb}}(E) \mathrm{d} E}+1\right)$
$q \Delta V_{\mathrm{oc}}^{\mathrm{non}-\mathrm{rad}}=-\mathrm{kT} \operatorname{Ln}\left(\mathrm{EQE}_{\mathrm{EL}}\right)$
$\mathrm{EQE}_{\mathrm{EL}}$ is the electroluminescence quantum efficiency.

### 2.5 TPC and TPV measurements

Transient photocurrent (TPC) and transient photovoltage (TPV) signals of the corresponding all-polymer solar cells were monitored using a Tektronix MDO3102 oscilloscope under a 337 nm 3.5 ns pulse laser ( $160 \mu \mathrm{~J}$ per pulse at 10 Hz ) and a 150 W halide lamps.

### 2.6 AFM and TEM measurements

Atomic force microscopy (AFM) images of blend films were recorded using a Dimension 3100 (Veeco) Atomic Force Microscope in the tapping mode. Transmission electron microscopy (TEM) was obtained by using a TePNai G2 F20 S-TWIN instrument at 200 kV accelerating voltage, in which the blend films were prepared using a processing technique, as follows: first, the blend film to be tested was spin-coated on an ITO/PEDOT:PSS substrate; then the obtained blend film on the substrate was immersed in deionized water and the separate blend film was peeled off by the interaction between PEDOT:PSS and water; finally, the blend film floating on the water surface was taken out using an unsupported 200 mesh copper mesh and used for TEM measurements.

### 2.7 GIWAXS measurements

GIWAXS measurements were performed at a Xeuss 2.0 SAXS/WAXS laboratory beamline using a Cu X-ray source ( $8.05 \mathrm{keV}, 1.54 \AA$ ) and a Pilatus3R 300K detector with a $0.2^{\circ}$ incidence angle. Samples were prepared on a Si substrate under the same conditions as those used for device fabrication.

### 2.8 Contact Angle measurement

The contact angle test was performed on a Dataphysics OCA20 Micro surface contact angle analyzer. The surface energy of the polymers was characterized and calculated by the contact angles of the two probe liquids (ultrapure water and diiodomethane) with the Owens and Wendt equation: $\gamma_{\mathrm{LV}}(1+\cos \theta)=2\left(\gamma_{\mathrm{S}}{ }^{\mathrm{d}} \gamma_{\mathrm{L}}{ }^{\mathrm{d}}\right)^{1 / 2}+$ $2\left(\gamma_{S}{ }^{\mathrm{p}} \gamma_{\mathrm{L}}{ }^{\mathrm{p}}\right)^{1 / 2}$, where $\gamma_{\mathrm{S}}$ and $\gamma_{\mathrm{L}}$ are the surface energy of the sample and the probe liquid, respectively. The superscripts $d$ and $p$ refer to the dispersion and polar components of the surface energy, respectively.

To calculate the wetting coefficient $(\omega)$, we should know the interfacial surface energy between different components first, which can be calculated by Neumann's equation as follows:
$\omega_{\mathrm{C}}=\frac{\gamma_{\mathrm{C}-\mathrm{B}}-\gamma_{\mathrm{C}-\mathrm{A}}}{\gamma_{\mathrm{A}-\mathrm{B}}}$
where $\gamma_{\mathrm{X} \text { - } \mathrm{Y}}$ is the interfacial surface energy between X and Y .

The interfacial surface energy can be calculated by Neumann's equation as follows:

$$
\gamma_{x-y}=\gamma_{x}+\gamma_{y}-2 \sqrt{\gamma_{x} \cdot \gamma_{y}} \cdot \mathrm{e}^{-\beta\left(\gamma_{x}-\gamma_{y}\right)^{2}}
$$

where $\beta=0.000115 \mathrm{~m}^{4} / \mathrm{mJ}^{2}$.

The location of the material C is estimated through $\omega_{\mathrm{C}}$. If $\omega_{\mathrm{c}}<-1$, material C will locate in domain B. If $-1<\omega_{\mathrm{c}}<-1$, material C will locate at the interface between material A and B. If $\omega_{\mathrm{c}}>1$, material C will locate in domain A.

### 2.9 Device Fabrication

All devices were fabricated with a conventional device structure of ITO/PEDOT: PSS/PM6: acceptor/PFN-Br/Ag under conditions as follows: The ITO-coated glass substrates were washed three times alternately with deionized water, acetone, and isopropanol, respectively, and then sprayed dry with nitrogen gas. After surface oxygen enrichment with UV-Ozone Cleaner, PEDOT: PSS (Heraeus Clevios P VP Al 4083) was spin-coated onto the clean ITO substrate at 6000 rpm for 45 s . Subsequently, the films are annealed on a hot plate at $150^{\circ} \mathrm{C}$ for 15 min . The donor and acceptor were mixed at a mass ratio of 1:1 and dissolved in chloroform (CF) at a total concentration of $16 \mathrm{mg} / \mathrm{mL}$, and $3 \mathrm{wt} \%$ of 1-chloronaphthalene (CN) was added to the solution as an additive. The mixed solution was maintained at $40^{\circ} \mathrm{C}$ on a hot plate and spin-coated onto the PEDOT: PSS films at 2500 rpm for 45 s , followed by annealing at $100^{\circ} \mathrm{C}$ for 10 min . Then, $1 \mathrm{mg} / \mathrm{mL}$ of PFN-Br solution was spin-coated on the active layer at 2500 rpm for 30 s . At last, 100 nm Ag was vapor deposited on the films under a ca. $4 \times 10^{-4}$ Pa pressure with a shadow mask to maintain the active area of the devices $\left(0.04 \mathrm{~cm}^{2}\right)$.
