**Figure S1.** 3-D simulation model of MIP coated optical fibre waveguide structure.

**Table S1.** Simulation parameters used for the optical fibre-waveguide structure simulation

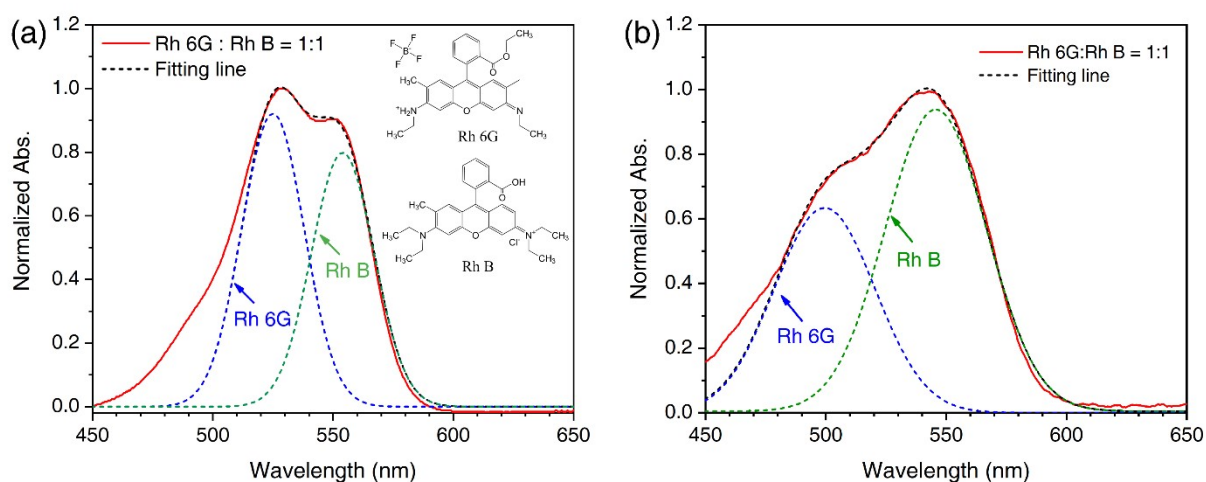

$n_{\text{waveguide}}$	1.44	$r_{\text{waveguide}}$	25 $\mu\text{m}$	$r_{\text{tapertop}}$	25 $\mu\text{m}$	$t_{\text{MIP}}$	1.5 $\mu\text{m}$
$n_{\text{fibreccladding}}$	1.45	$r_{\text{fibrecore}}$	30 $\mu\text{m}$	$l_{\text{waveguide}}$	100 $\mu\text{m}$	Wavelength	550 nm
$n_{\text{fibrecore}}$	1.455	$r_{\text{fibreccladding}}$	50 $\mu\text{m}$	$l_{\text{taper}}$	20 $\mu\text{m}$	Method	Beam envelopes
$n_{\text{MIP}}$	1.57	$r_{\text{taper bottom}}$	45 $\mu\text{m}$	$l_{\text{fibre}}$	50 $\mu\text{m}$		

**Figure S2.** A typical simulation result of optical fibre-waveguide structure without high-n MIP coating layer. The propagation light is confined in the waveguide core, which is distinguished with that of MIP coated model.

**Figure S3.** Optical losses of HQNPs hybrid waveguide as a function of waveguide refractive index. The hybrid waveguide lengths were fixed at 6 mm.

**Figure S4.** (a) The absorption spectrum of the Rh 6G and Rh B mixture measured by non-selective Shimadzu UV-vis 2600 spectrometer. The insets show the molecular structures of Rh 6G and Rh B, respectively. (b) The spectrum measured by MIP-OFHWF sensing system. The concentration of both Rh 6G and Rh B was  $1.0 \times 10^{-6}$  g/ml. The red solid line represents the experimental data, while the dashed lines represent the fitting lines. The black dashed line represents the sum of the blue and green dashed lines.

**Figure S5.** Correlation between normalized fluorescent intensity  $S$  and the Rh B concentration measured by NIP-OFHWF.

## MIP layer coating process:

### 1. MIP precursor preparation

Polyethylene glycol 600 diacrylate (PEGDA, 5 g), 2-phenylphenoxyethyl acrylate (OPPEA, 10 g), ethanol (1.5 ml), and Rh B (0.005 g) were weighed into a 20 ml vial and stirred for 2 h at room temperature. Thereafter, 0.06 g of methylacrylic acid (MAA) and 0.05 g of Diphenyl(2,4,6-trimethylbenzoyl)phosphine oxide (TPO) were added to the mixture and stirred for 1 h to achieve homogeneity. The mixture was filtered through a 0.25  $\mu\text{m}$  filter to decrease the non-solvated residues.

### 2. MIP coating procedure

The MIP precursor was dropped on the HQNPs hybrid waveguide section of the OFWF, after which 405 nm laser light was launched into the optical fibre, with a laser output of 20  $\mu\text{W}$ , for 5 min. Under EW irradiation from the hybrid waveguide, the MIP precursor near the surface of the hybrid waveguide was cured and formed a thin MIP layer with a thickness of approximately  $\sim 1.5 \mu\text{m}$ .

### 3. Removal of templated molecules

The MIP-covered hybrid waveguide was immersed in ethanol for 5 min to rinse away the non-cured monomers and Rh B molecular templates. Removal of the Rh B templates was confirmed directly by microscopic observation. Under the 405 nm light irradiation, the Rh B contained waveguide emits strong yellow fluorescence, while the de-temple waveguide only scatters purple laser light.
