Figure S9. ^1H Spectrum of $[\text{Fe}(\text{TOAB})]\text{Br}_2$ at 15.0 mM (500 MHz, D_2O , 298K)

Figure S10. UV-Vis absorbance spectra of TOAB-H ligand and $[\text{Fe}(\text{TOAB})]\text{Br}_2$; TOAB-H solution contained 0.20 mM ligand. Fe solution contained 0.20 mM $[\text{Fe}(\text{TOAB})]\text{Br}_2$ in 1x PBS Buffer (pH 7.1) and was incubated at 37 °C for 72 hours

Figure S11. UV-Vis absorbance spectra of 145 μM $[\text{Fe}(\text{TOAL-H}^+)]\text{Cl}$ in methanol at 37 $^\circ\text{C}$

Complex	Wavelength (nm)	Molar absorptivity ($\text{M}^{-1}\text{cm}^{-1}$)
$[\text{Fe}(\text{TOAB})]\text{Br}_2$	300	3.83×10^3
$[\text{Fe}(\text{TOAL-H}^+)]\text{Cl}$	206	9.40×10^3
	247	6.98×10^3
	332	3.97×10^3

Table S1. Molar absorptivity ($\text{M}^{-1}\text{cm}^{-1}$) of the complexes at 37 $^\circ\text{C}$

	Time	R ₁ (s ⁻¹) saline	R ₂ (s ⁻¹) saline	R ₁ (s ⁻¹) serum	R ₂ (s ⁻¹) serum
LipoA	1 day	0.67	4.9	0.65	2.6
	2 day	0.69	5.0	0.76	2.8
LipoC	1 day	0.93	5.5	2.3	8.5
	2 day	0.88	5.5	2.8	8.0
LipoB	1 day	2.8	20	2.1	9.7
	2 day	2.8	19	2.0	12

Table S2. Relaxivity of liposomes over time measured at 37 °C, pH 7.4 and 9.4 T.

(Stored at 4 °C)

AGENT	r₁ (mM⁻¹s⁻¹)	r₂ (mM⁻¹s⁻¹)	r₁ (mM⁻¹s⁻¹)	r₂ (mM⁻¹s⁻¹)
	1.4 T	1.4 T	9.4 T	9.4 T
LipoA	1.67 × 10 ³	2.28 × 10 ³	1.7 × 10 ³	1.3 × 10 ⁴
LipoB	2.6 × 10 ⁴	4.0 × 10 ⁴	2.8 × 10 ⁴	1.9 × 10 ⁵
LipoC	7.8 × 10 ³	2.3 × 10 ⁴	1.3 × 10 ⁴	7.3 × 10 ⁴

Table S3. r₁ and r₂ proton relaxivity values based on iron liposome (per-particle) concentration^a

^aValues are reported at 9.4 T (37 °C) and 1.4 T (34 °C), pH 6.8-7.2. The total lipid concentration was converted into liposome concentration by approximation of the number of lipid molecules in a liposome of 100 nm size. A plot of R₁ versus liposome concentration gave the per particle relaxivity.

Figure S12. CMC determination for $[Fe(TOAL)]^{2+}$ micelles at 1.4T and 34 °C.

A break at 0.19 mM concentration for $[Fe(TOAL)]^{2+}$ micelle was observed indicating the presence of CMC.

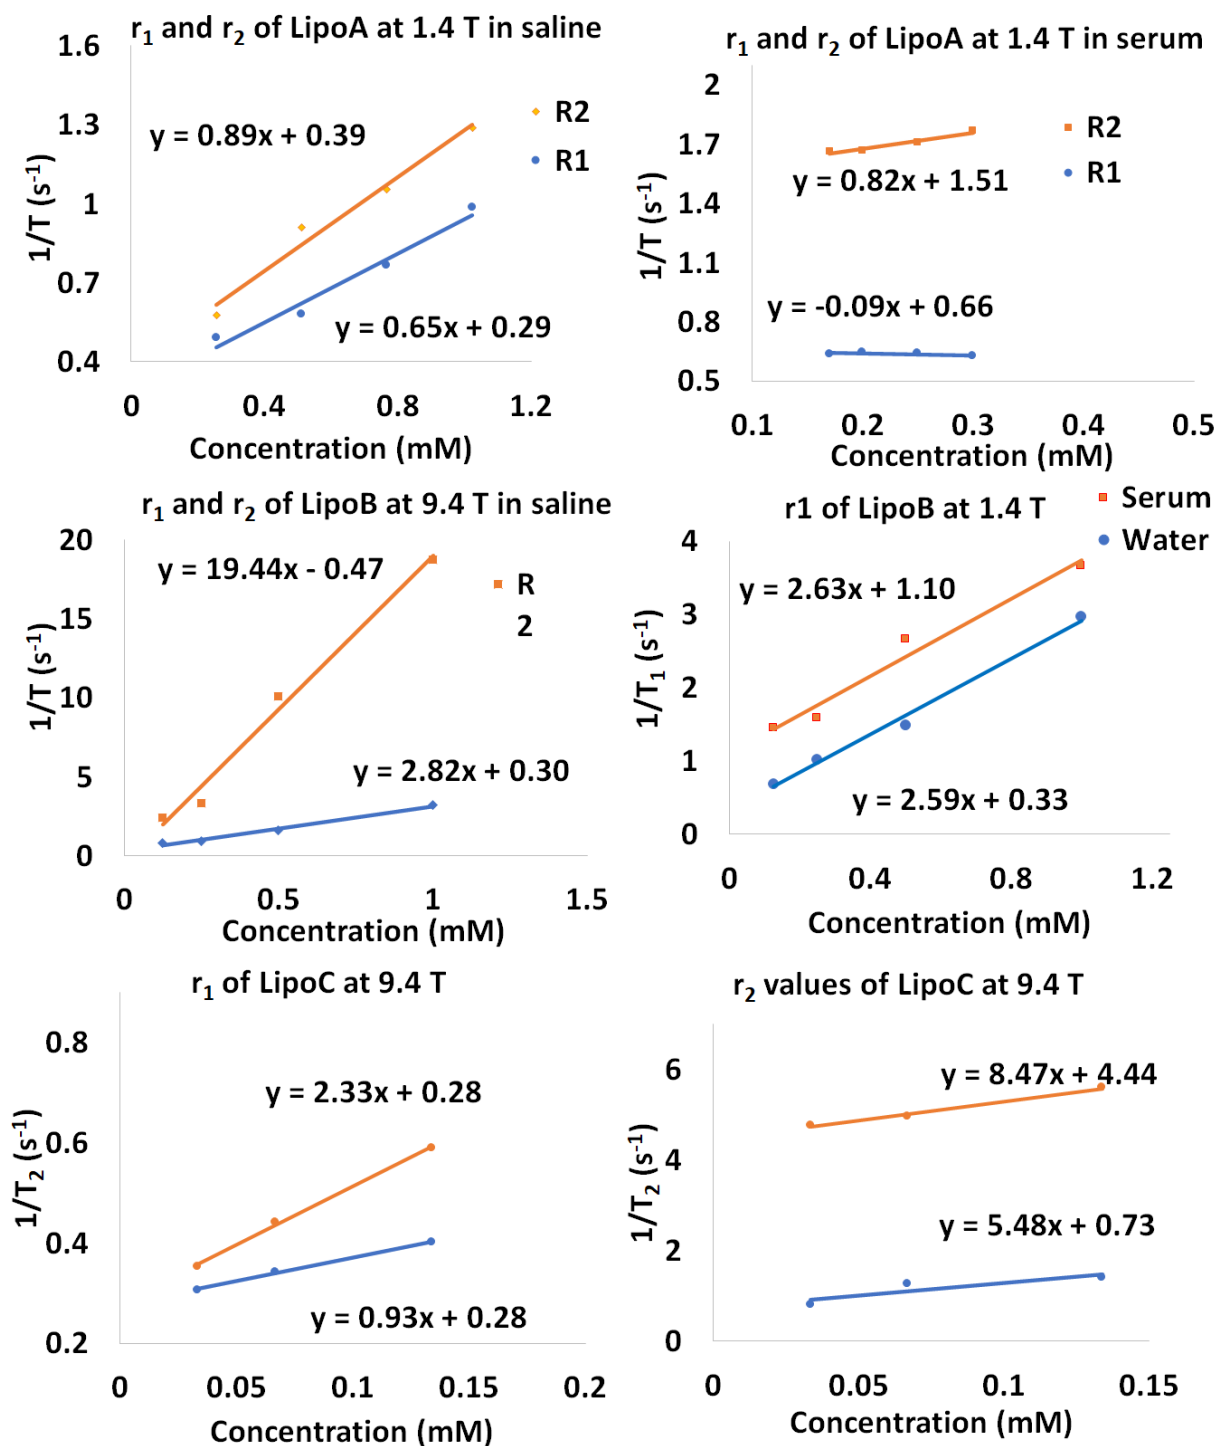

Figure S13. Sample r_1 and r_2 proton relaxivities of LipoA, LipoB and LipoC liposomes in aqueous/serum solutions at 1.4 T (34 °C) / 9.4 T (37 °C) as a function of liposome iron concentration. The relaxivities from the slopes are reported in Table 1. For the lower four graphs, orange is for experiments in serum and blue is in saline.

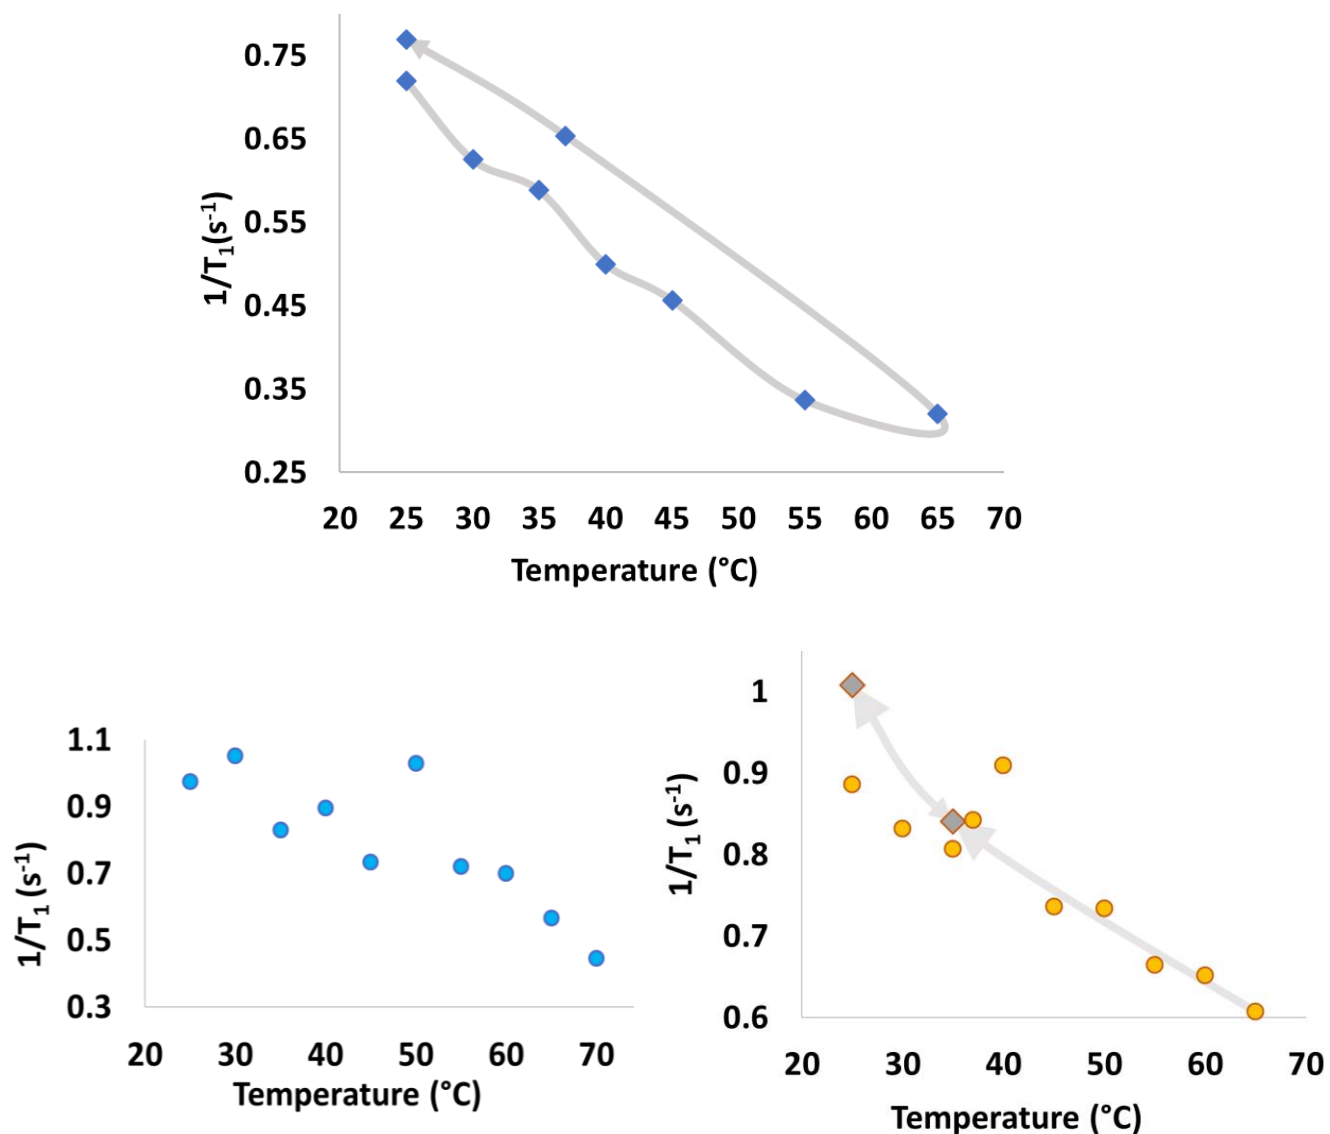

Figure S14. $1/T_1$ dependence on temperature for LipoA (top), LipoB (left) and LipoC (right) sample; Temperature was increased at $5^{\circ}C$ steps from 25 $^{\circ}C$ to 65-70 $^{\circ}C$ and then decreased to 25 $^{\circ}C$. Each incubation was for 7 minutes. Lines are drawn to connect the sequential data points during cooling.

Arrow = Right Kidney

0 1500

Arrow = Bladder

0 1500

Figure S15. Biodistribution and clearance of LipoA in a healthy BALB/c mouse; Dose was 50 $\mu\text{mol/kg}$ iron. Orange arrow shows Kidney (top) and bladder (bottom)

Figure S16. Biodistribution and clearance of LipoB in a CT26 tumored BALB/c mice; Dose was 50 μmol iron per kg. Distribution to Tumor (T), Liver (L), Vena cava (V), Kidney (K) and Bladder (B) are highlighted in 10' post LipoB injection MRI.

Figure S17. Biodistribution and clearance of LipoC in a CT26 tumored BALB/c mice; Dose- 100 μmol Fe(III) per kg of mouse body weight.

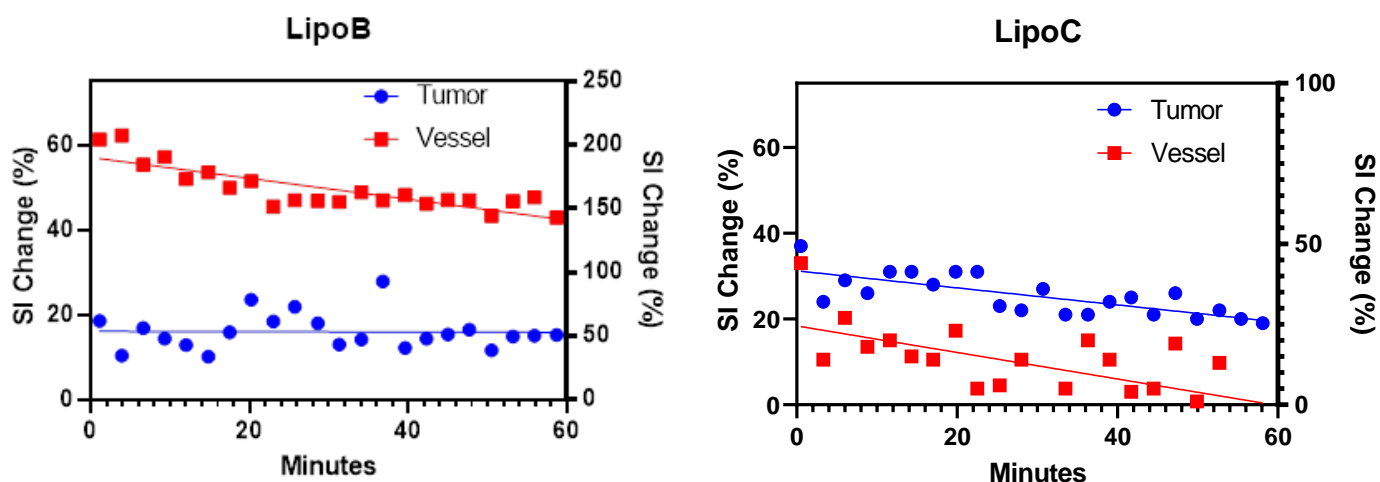

Figure S18. Change in T_1 -weighted signal intensity for LipoB (50 μmol [Fe] /kg) and LipoC (125 μmol [Fe] /kg) in CT26 murine tumor over time compared to signal in blood vessel.

	LipoA	LipoB	LipoC
Fe(III) CA Dose ($\mu\text{mol}/\text{Kg}$)	55.0	50.0	100
1st order 'k' (min^{-1})	6.7×10^{-2}	9.9×10^{-3}	3.4×10^{-2}
$t_{1/2}$ (min)	10.3	70.0	20.3
Ratio of V_d 2-3 min after injection (ml)	3.2	1.2	11

Table S4. Dose, first order elimination rate constants, half-lives and volume of distribution (V_d) ratio at 2-3 min after LipoA, LipoB and LipoC injections. $V_d = \text{dose}/C_p$; $V_d \propto \frac{\text{dose}}{\Delta\text{Signal}/R_{1,obs}}$. $R_{1,obs}$ of LipoA, LipoB and LipoC in serum were 0.60, 1.8 and 1.7 respectively for calculation at their administered concentration.

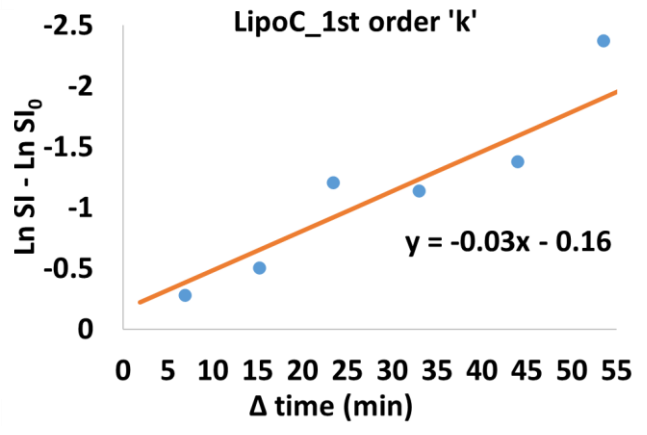

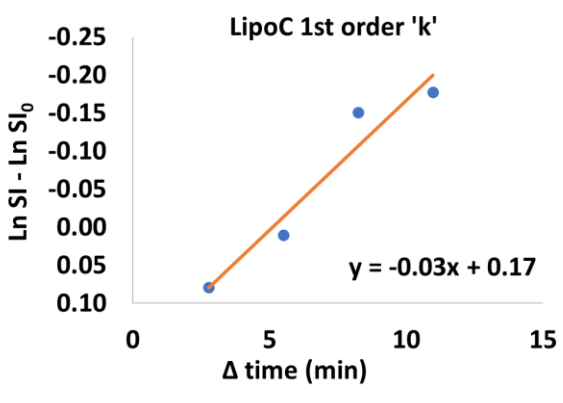

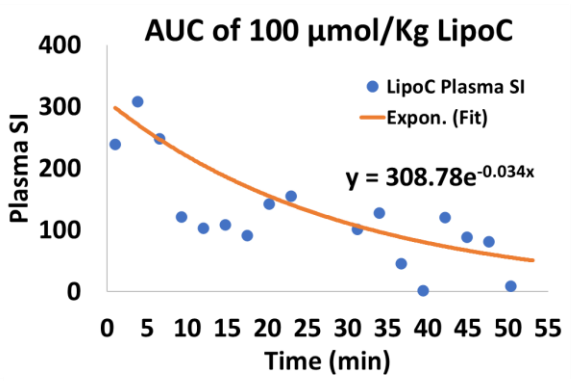

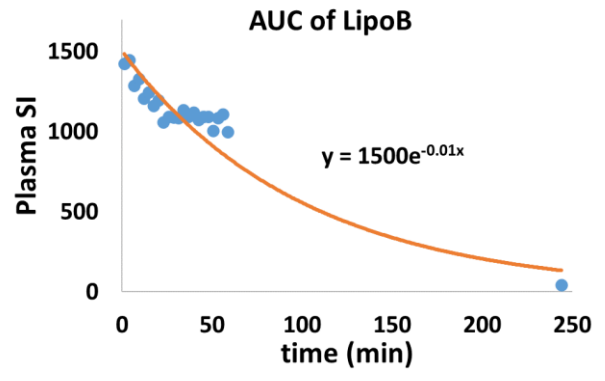

Figure S19. AUC graph and elimination rate constants of LipoA, LipoB and LipoC in Vena Cava

Intercept: 0.800	Peak 3: 2418	0.6	336.3

Result quality : Refer to quality report

Figure 20d. DLS size measurement of FeTOAL micelle

$$\text{Total number of lipid per liposome, } N_{tot} = \frac{4 \times \pi \times (r - h)^2 + 4 \times \pi \times (r)^2}{\text{Lipid head group average surface area}}$$

Number of Liposomes, N_{Lipo}

$$= \frac{\text{Liposome volume (L)} \times \text{Liposome concentration (M)} \times \text{Number of Avogadro}}{\text{Total number of lipid per liposome, } N_{tot}}$$

$$\text{Permeability, } P_w = \frac{1000 \times d^{inner} \times r_1^{overall} \times r_1^{inner} \times [CA]^{inner}}{6(r_1^{inner} - r_1^{overall})} \quad (1)$$

$$\text{Water residence time, } \tau = \frac{d^{inner}}{6 \times P_w} \quad (2)$$

$$r_{1, in} = \frac{f_{in}}{v_{in}} \times r_{1, CA} \quad (3)$$

$$r_{1, out} = (1 - f_{in}) \times r_{1, CA} \quad (4)$$

$$r_1 = r_{1, out} + \frac{v_{in}}{\frac{1}{r_{1, in}} + \tau} \quad (5)$$

The water permeability of the liposomal membranes was determined following a method described by Terreno and co-workers¹ and later used in another work by Peters et al². The unencapsulated Fe(NOTP) was removed by dialysis for 24 - 48 h at 4°C . A value of 11.5×10^{-5} cm.s⁻¹ was found for LipoA for the P_w . The water residence time of LipoA was found 13.8 μs at 34 °C and 1.4 T.

For LipoA, LipoB and LipoC, $v_{in} = 0.0297, 0.0319$ and 0.0145 were estimated from the volume and per mM concentration of [CA] in liposomes.

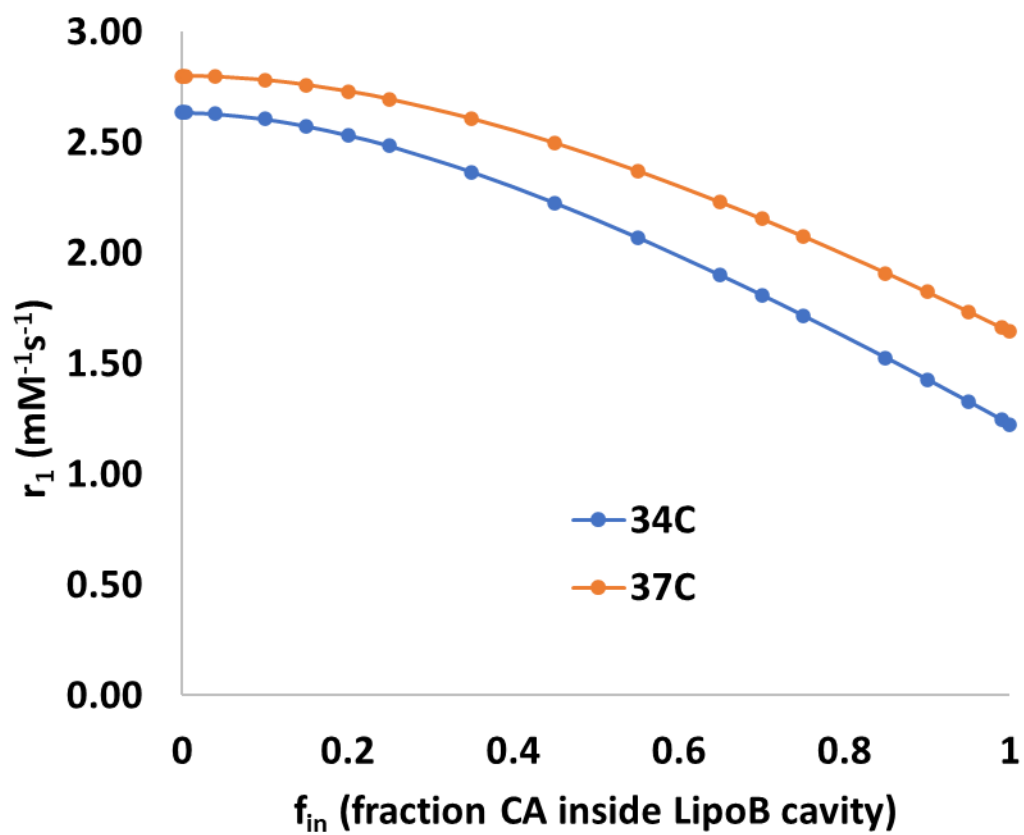

Figure 21. The relaxivity of LipoB as a function of the fraction of the contrast agent that are inside the liposomal core, as calculated with equations 3-5 at 34 °C, 1.4 T, 37 °C at 9.4 T.
