## 1. Materials and methods

Commercially available chemicals were used without any purification; solvents were dried following the standard procedures. Chromatography was performed using either silica gel (60-120 mesh) or neutral aluminium oxide. For thin layer chromatography, aluminium sheets pre-coated with silica gel were employed. IR spectra were recorded on a Perkin Elmer IR spectrometer at normal temperature by using KBr pellet. The spectral positions are given in wave number $\left(\mathrm{cm}^{-1}\right)$ unit. NMR spectra were recorded using Bruker 600 MHz NMR spectrometer. For ${ }^{1} \mathrm{H}$ NMR spectra, the chemical shifts are reported in ppm relative to TMS as an internal standard. Coupling constants are given in Hz . Mass spectra were determined from MALDI-TOF mass spectrometer using $\alpha$-Cyano-4-hydroxycinnamic acid as a matrix or High Resolution Mass Spectrometer. The mesogenic compounds were investigated for their liquid crystalline behavior (birefringence and fluidity) by employing a polarizing optical microscope (Nikon Eclipse LV100POL) equipped with a programmable hot stage (Mettler Toledo FP90). Clean glass slides and coverslips were employed for the polarizing optical microscopic observations. The transition temperatures and associated enthalpy changes were determined by differential scanning calorimeter (Mettler Toledo DSC1) under nitrogen atmosphere. Peak temperatures obtained in DSC corresponding to transitions were in agreement with the polarizing optical microscopic observations. The transition temperatures obtained from calorimetric measurements of the first heating and cooling cycles at a rate of $5{ }^{\circ} \mathrm{C} / \mathrm{min}$ are tabulated. Variable temperature X-ray diffraction measurements were carried out with samples filled in Lindemann capillaries. The apparatus essentially involved a high resolution X-ray powder diffractometer (PANalytical X'pert pro) with a high resolution fast detector PIXCEL. The temperature of the sample was varied using a Mettler hot stage/ programmer (FP82HT/FP90). Thermogravimetric analysis (TGA) was performed using thermogravimetric analyzer (Mettler Toledo, model TG/SDTA 851 e) under a nitrogen flow at a heating rate of $10{ }^{\circ} \mathrm{C} / \mathrm{min}$. UV-Vis spectra were obtained by using Perkin-Elmer Lambda 750, UV/VIS/NIR spectrometer. Fluorescence emission spectra in solution state were recorded with Horiba Fluoromax-4 fluorescence spectrophotometer or Perkin Elmer LS 50B spectrometer. Cyclic Voltammetry studies were carried out using a Versa Stat 3 (Princeton Applied Research) Electrochemical workstation.

For SCLC measurements, devices were fabricated in either electron-only (ITO/ZnO/NDIs/Ag) or hole-only (ITO/PEDOT: PSS/NDIs/MoO3-Ag) architecture. In brief, pre patterned indium tin oxide (ITO) substrates (Xinyan Technologies, Taiwan, $15 \Omega / \square$ ) were first cleaned using 3\% soap solution in deionized water (Hellmanex III, Sigma-Aldrich) followed by cleaning with deionized water, acetone, and isopropyl alcohol for 20 minutes each sequentially in an ultrasonicator. The substrates were then gently blown dry with nitrogen gas and exposed to UV ozone treatment for 30 minutes at $50^{\circ} \mathrm{C}$ (BioBEE Tech, India) to remove any organic residues. For the fabrication of the hole only device (ITO/PEDOT: PSS/PBIs/MoO3-Ag), a 40 nm PEDOT:PSS (Sigma Aldrich) layer was first spin coated at 4000 rpm for 65 seconds with a ramp rate of 2000 rpm followed by annealing of at $150{ }^{\circ} \mathrm{C}$ on a hot plate for 20 minutes under ambient conditions. The active layer for both the NDIs was then spin coated on PEDOT: PSS at 1500 rpm for 45 seconds from a $10 \mathrm{mg} / \mathrm{ml}$ solution in
chloroform to achieve a thickness of 100 nm (measured using Dektak surface profilometer). Finally, a top contact of 7 nm of $\mathrm{MoO}_{3}$ and 100 nm of Ag layer was sequentially thermally evaporated under high vacuum ( $2.2 \times 10^{-6} \mathrm{mbar}$, Hind High Vacuum, India) to complete the devices. For, electron only device, a ZnO sol gel solution ( 200 mg zinc acetate dihydrate ( Zn $\left.\left(\mathrm{CH}_{3} \mathrm{COO}\right)_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}\right)+52 \mathrm{mg}$ ethanolamine in 2 mL 2 -methoxy ethanol, agitated heavily overnight and filtered using $0.45 \mu \mathrm{~m}$ PTFE filter) was spin coated on cleaned ITO substrates obtain a thickness of $\sim 30 \mathrm{~nm}$ ( 4500 rpm for 45 sec followed by annealing at $180^{\circ} \mathrm{C}$ for 1 hour under ambient conditions). An active layer for both NDIs were then spin coated similar to what used for hole only devices. Finally, top contact of 100 nm Ag was evaporated at $2.2 \times 10^{-6}$ mbar pressure for complete device. The active area of all devices was $0.066 \mathrm{~cm}^{2}$ (measured through the overlap of ITO and top contact). Dielectric constant of NDIs was extracted from capacitance-voltage characteristics using high-frequency LCR meter ZM2376 (NF Corporation) with an applied oscillation level voltage of 1V and frequency sweep from 20 Hz to 2 MHz .

## 2. Experimental Section:

## Scheme S1. Synthesis of NDI ${ }^{010}$

Reagents and conditions: (i) $\mathrm{K}_{2} \mathrm{CO}_{3}$, Dry DMF, $\mathrm{C}_{10} \mathrm{H}_{21} \mathrm{Br}, 80^{\circ} \mathrm{C}, 12 \mathrm{~h}, 75 \%$ yield, (ii) $\mathrm{NaNO}_{2}, \mathrm{HNO}_{3}, 0^{\circ} \mathrm{C}, 1 \mathrm{~h}$, $86 \%$ yield, (iii) $\mathrm{N}_{2} \mathrm{H}_{4} \cdot \mathrm{H}_{2} \mathrm{O}, \mathrm{EtOH}, \mathrm{H}_{2}-\mathrm{Pd} / \mathrm{C}$, rt, overnight, $74 \%$ yield, (iv) $\mathrm{Zn}(\mathrm{OAc})_{2}$, imidazole, microwave irradiation, $35 \mathrm{~W}, 35 \mathrm{~min}, 165^{\circ} \mathrm{C}, 82 \%$.

Compounds 2, ${ }^{[S 1]} \mathbf{3},{ }^{[S 1]} \mathbf{4},{ }^{[S 2]} \mathbf{6},{ }^{[S 4]} \mathbf{7},{ }^{[S 5]} \mathbf{8}^{[S 5]}$ were prepared as reported earlier. NDI ${ }^{\mathbf{0 1 0}}$ and NDI ${ }^{10}$ were prepared by following the method used for the synthesis of perylene bisimides. ${ }^{[S 3]}$

## Procedure for synthesis of NDI ${ }^{\text {O10 [S3] }}$

Naphthalene-3,4,9,10-tetracarboxylic dianhydride (1 eq.), tridecyloxy aniline ( 2.2 eq.), zinc acetate ( 2 eq.) and imidazole ( 1 g ) were taken in a microwave vessel, flushed with nitrogen and put in microwave reactor. The mixture was heated at $165^{\circ} \mathrm{C}$ for 35 minutes at 35 W and 100 psi pressure. After cooling, reaction mixture was poured in $2(\mathrm{~N}) \mathrm{HCl}(10 \mathrm{~mL})$ and extracted
with chloroform. Organic mixture was washed with water and saturated sodium chloride solution. The crude compound was purified by neutral alumina column chromatography using $50 \%$ chloroform-hexane system. Further purification was done by recrystallization from chloroform-methanol system.
$R_{f}=0.5$ ( $30 \%$ EtoAc-Hexane); Creamy brown solid, yield: $82 \%$; IR ( KBr pellet) $v_{\text {max }}$ in $\mathrm{cm}^{-1}$ 2921, 2852, 1705, 1666, 1592, 1502, 1466, 1434, 1365, 1320, 1233, 1113, 795, 745, 722; ${ }^{1} \mathrm{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{CDCl}_{3}, 299 \mathrm{~K}$ ): $\delta 8.83\left(\mathrm{~s}, 4 \mathrm{H}, \mathrm{H}_{\mathrm{Ar}}\right), 6.50\left(\mathrm{~s}, 4 \mathrm{H}, \mathrm{H}_{\mathrm{Ar}}\right), 4.04(\mathrm{t}, J=7.8 \mathrm{~Hz}, 4 \mathrm{H}$, $\left.2 \times-\mathrm{OCH}_{2}\right), 3.95\left(\mathrm{t}, J=7.8 \mathrm{~Hz}, 8 \mathrm{H}, 4 \times-\mathrm{OCH}_{2}\right), 1.81-1.26(\mathrm{~m}, 96 \mathrm{H}$, alkyl chain), $0.88(\mathrm{~m}, 18 \mathrm{H}$, $6 \times-\mathrm{CH}_{3}$ ); ${ }^{13} \mathrm{C}$ NMR ( $150 \mathrm{MHz}, \mathrm{CDCl}_{3}, 298.1 \mathrm{~K}$ ); $\delta 162.99,153.79,138.61,131.44,129.36$, 127.10, 127.04, 106.70, 73.57, 69.15, 31.98, 31.92, 30.43, 29.80, 29.73, 29.65, 29.60, 29.44, $29.41,29.36,29.33,26.16,26.11,22.74,22.70,14.15,14.13$. MALDI-TOF mass calculated for $\mathrm{C}_{86} \mathrm{H}_{135} \mathrm{~N}_{2} \mathrm{O}_{10}\left(\mathrm{M}+\mathrm{H}^{+}\right)$: 1357.02, found: 1357.841 .

Scheme S2. Synthesis of NDI ${ }^{10}$

Scheme 2. Reagents and conditions. (i) $\mathrm{NaNO}_{2}, \mathrm{H}_{2} \mathrm{SO}_{4}, \mathrm{AcOH}, \mathrm{H}_{2} \mathrm{O}, \mathrm{KI}, 9{ }^{\circ} \mathrm{C}$, ( $91 \%$ ), (ii) $\mathrm{CuI}, \mathrm{Et}_{3} \mathrm{~N}$, $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{2}, 8{ }^{\circ} \mathrm{C}, 4 \mathrm{~h},(89 \%)$, (iii) $\mathrm{EtOAc}, \mathrm{MeOH}, \mathrm{H}_{2}-\mathrm{Pd} / \mathrm{C}$, rt, overnight $(95 \%)$, (iv) $\mathrm{Zn}(\mathrm{OAc})_{2}$, imidazole, microwave irradiation, $35 \mathrm{~W}, 35 \mathrm{~min}, 165^{\circ} \mathrm{C}$ ( $86 \%$ ).

## Procedure for synthesis of NDI ${ }^{10}$ [33]

Naphthalene-3,4,9,10-tetracarboxylic dianhydride (1 eq.), tridecyl aniline ( 2.2 eq .), zinc acetate ( 2 eq .) and imidazole ( 1 g ) were taken in a microwave vessel, flushed with nitrogen and put in microwave reactor. The mixture was heated to $165^{\circ} \mathrm{C}$ for 35 minutes at 35 W and 100 psi pressure. After cooling, reaction mixture was poured into a $2 \mathrm{~N} \mathrm{HCl}(10 \mathrm{~mL})$ solution and extracted with chloroform. Organic layer was washed with water and saturated sodium chloride solution. The crude compound was purified by neutral alumina column chromatography using $50 \%$ chloroform-hexane system. Further purification was done by recrystallization from chloroform-methanol system.

NDI $^{\mathbf{1 0}}: \mathrm{R}_{f}=0.6\left(10 \%\right.$ EtOAc-Hexane); Off white powdered solid, yield: 86\%; IR: $v_{\max }$ in $\mathrm{cm}^{-1}: 2922,2853,1716,1674,1581,1467,1348,1248,1197,1119,980,878,819,767,743$; ${ }^{1} \mathrm{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{CDCl}_{3}, 299 \mathrm{~K}$ ): $8.82\left(\mathrm{~s}, 4 \mathrm{H}, \mathrm{H}_{\mathrm{Ar}}\right), 6.95\left(\mathrm{~s}, 4 \mathrm{H}, \mathrm{H}_{\mathrm{Ar}}\right), 2.65(\mathrm{t}, J=7.8 \mathrm{~Hz}$, $\left.12 \mathrm{H}, 6 \times-\mathrm{CH}_{2}\right), 1.6\left(\mathrm{~m}, 12 \mathrm{H}, 6 \times-\mathrm{CH}_{2}\right), 1.5-1.1\left(\mathrm{~m}, 84 \mathrm{H}, 42 \times-\mathrm{CH}_{2}\right), 0.88(\mathrm{~m}, 18 \mathrm{H}, 6 \times-$ $\mathrm{CH}_{3}$ ); ${ }^{13} \mathrm{C}$ NMR ( $150 \mathrm{MHz}, \mathrm{CDCl}_{3}, 298.1 \mathrm{~K}$ ): $\delta 163.41,142.65,139.96,131.92$, 131.57, $127.35,127.33,126.27,33.41,32.22,32.19,31.87,31.52,30.97,30.70,30.23,29.96,29.92$, 29.88, 29.79, 29.68, 29.63, 29.08, 22.99, 22.96, 22.94, 14.43, 14.41; MALDI-TOF mass calculated for $\mathrm{C}_{86} \mathrm{H}_{135} \mathrm{~N}_{2} \mathrm{O}_{4}\left(\mathrm{M}+\mathrm{H}^{+}\right): 1261.04$, found: 1261.919.

## 3. NMR Spectra

Figure S1. ${ }^{1} \mathrm{H}$ NMR ( 600 MHz ) spectrum of $\mathbf{N D I ~}^{\mathbf{0 1 0}}$ in $\mathrm{CDCl}_{3}$.

Figure S2. ${ }^{13} \mathrm{C}$ NMR ( 150 MHz ) spectrum of $\mathbf{N D I}^{\mathbf{0 1 0}}$ in $\mathrm{CDCl}_{3}$.

## 12. Charge Carrier Mobility Studies

Charge carrier mobility study of reported NDI based compounds were carried out using Space Charge Limited Current (SCLC) method. A device with ITO/PEDOT: PSS / NDIs / $\mathrm{MoO}_{3} / \mathrm{Ag}$
structure was fabricated for finding the hole mobility whereas ITO/ZnO/ NDIs/Ag was used for finding electron-mobility. In hole and electron only devices ITO/PEDOT: PSS and $I T O / \mathrm{ZnO}$ combination was chosen for hole and electron injection. For achieving SCLC regime an Ohmic contact is fundamental requirement with material under test in both hole (Injecting electrode-HOMO) as well as electron (Injecting electrode-LUMO) only devices. Detailed experimental details can be find in the SI section.

In SCLC technique at initial low voltages current follows ohmic with slope of one whereas at higher voltages, where injected charges dominate over intrinsic charges SCLC regime with a slope two is observed. Considering material to be trap free charge mobility of the material can be extracted using Mott-Gurney law given by equation 1

$$
\begin{equation*}
J=\frac{9}{8} \varepsilon_{0} \varepsilon_{\mathrm{r}} \mu \frac{V^{2}}{d^{3}} \tag{1}
\end{equation*}
$$

Where $\varepsilon_{0}$ is the permittivity of free space $\left(8.86 \times 10^{-14} \mathrm{~F} / \mathrm{cm}\right), \varepsilon_{r}$ represents the relative dielectric constant of the material ( $\mathbf{N D I}^{\mathbf{0 1 0}} \sim 3.85$ and $\mathbf{N D I}^{\mathbf{1 0}} \sim 4.87$ ), $V$ is the applied voltage, $d$ is the thickness of the material and $J$ is density. In thin films where applied electric field is much higher as compared to the bulk, modified Mott-Gurney equation is widely used where a field-dependent charge mobility correction is introduced for the charge mobility calculation shown in equation 2.

$$
\begin{equation*}
J=\frac{9}{8} \varepsilon_{\mathrm{r}} \varepsilon_{0} \mu \frac{V^{2}}{d^{3}} \exp \left(0.891 \gamma \sqrt{\frac{V}{d}}\right) \tag{2}
\end{equation*}
$$

where $\gamma$ is the fitting parameter that represents the strength of the field dependence of mobility. In this work modified Mott-Gurney equation was used for fitting the measured $J-V$ curves for both NDIs to extract hole and electron mobilities. Electron and hole mobility values for both NDIs is summarized in Table S5. Figures 4a,b represent the observed as well as SCLC fitted curves for both NDIs respectively. The reported mobility values for both electron and hole are an average of at least 5 devices (Table S5).

Table S5. Hole and electron mobility values for both NDIs

| Entry | NDI ${ }^{10}$ | NDI ${ }^{\text {O10 }}$ |
| :---: | :---: | :---: |
| $\begin{aligned} & \text { Hole mobility } \\ & \left(\mathrm{cm}^{2} / \mathrm{V} . \mathrm{s}\right) \end{aligned}$ | 1.49E-03 | $2.77 \mathrm{E}-03$ |
|  | $2.67 \mathrm{E}-03$ | $3.28 \mathrm{E}-03$ |
