## 1. General

All reagents and solvents were used as received from commercial suppliers.  $^1\text{H}$  and  $^{13}\text{C}$  NMR spectra were measured on a Bruker AV400M (400 MHz) spectrometer. Residual proton and carbon of deuterated solvents were used as internal standards for the measurements:  $\delta = 7.26$  ppm ( $\text{CDCl}_3$ ) and  $\delta = 2.50$  ppm ( $\text{DMSO}-d_6$ ) for  $^1\text{H}$  NMR,  $\delta = 77.16$  ppm ( $\text{CDCl}_3$ ) and  $\delta = 39.52$  ppm ( $\text{DMSO}-d_6$ ) for  $^{13}\text{C}$  NMR. HR-MS analyses were conducted on a JEOL JMS-700 instrument. Thermo gravimetric (TG) analyses were performed on Rigaku Thermo plus EVO2 (TG-DTA8122) under an  $\text{N}_2$  purge (300 mL/min) at a heating rate of  $5\text{ }^\circ\text{C min}^{-1}$ . Crystal structures were drawn using Mercury<sup>S1</sup> software. Powder X-ray diffraction (PXRD) data were collected on PANalytical XPert PRO X'Celetor (45 kV, 40 mA) using Cu-K $\alpha$  radiation at room temperature with a scan rate of  $1.2^\circ\text{min}^{-1}$  or on Rigaku MiniFlex 600 (40 kV, 15 mA) using Cu-K $\alpha$  radiation at room temperature with a scan rate of  $4^\circ\text{min}^{-1}$ .

**Single crystal X-ray or electron diffraction measurement and analysis.** **CP-Py-1(DCB), CP-Py-1(TCB), CP-Py-2(DCB), CP-Py-2(TCB)** and **CP-Py-1(MeNaph)** were collected at 113 K with a two-dimensional X-ray detector (PILATUS 200K/R) equipped on a Rigaku XtaLAB P200 diffractometer by using Mo-K $\alpha$  radiation monochromated with multilayer mirror ( $\lambda = 0.71073\text{ \AA}$ ). Diffraction data of **CP-Py-1(DMAri), CP-Py-2(DMAri)** and **CP-Py-3** was collected with a two-dimensional X-ray detector (Pilatus 100K) at SPring-8 (BL40XU) by using synchrotron radiation ( $\lambda = 0.81106\text{ \AA}$ ). Diffraction Data collection, cell refinement, and data reduction were carried out with CrysAlis PRO.<sup>S2</sup> SHELXT<sup>S3</sup> was used for the structure solution of the crystals. These calculations were performed with the observed reflections [ $I > 2\sigma(I)$ ] with the program OLEX-2 crystallographic software.<sup>S4</sup> Structural refinement was performed by SHELXL.<sup>S5</sup> All non-hydrogen atoms were refined with anisotropic displacement parameters, and hydrogen atoms were placed in idealized positions and refined as rigid atoms with the relative isotropic displacement parameters. For structural analysis of **CP-Py-1(TCB), CP-Py-1(DMAri)** and **CP-Py-3**, SQUEEZE function equipped in the PLATON program was used to treat severely disordered solvent molecules in voids.<sup>S6</sup>

**Gas sorption experiments.** The activated bulk sample of **CP-Py-3** was used for gas sorption measurements, which were performed on BELSORP-max (BEL, Japan) or Micromeritics 3Flex. The adsorption isotherms of  $\text{N}_2$ ,  $\text{CO}_2$  were corrected at 77K and 195 K, respectively. Brunauer–Emmett–Teller (BET) specific surface area:  $S_{\text{A(BET)}}$  was based on  $\text{CO}_2$  absorption isotherms.

## 2. Experimental data
