## Methods and materials

All manipulations were performed either under an atmosphere of dry argon or in vacuo using standard Schlenk line or glovebox techniques. Deuterated solvents were dried over molecular sieves and degassed by three freeze-pump-thaw cycles prior to use. All other solvents were distilled and degassed from appropriate drying agents. Both deuterated and non-deuterated solvents were stored under argon over activated $4 \AA$ molecular sieves. NMR spectra were acquired either on a Bruker Avance 500 (operating at 500 MHz for ${ }^{1} \mathrm{H}, 125 \mathrm{MHz}$ for ${ }^{13} \mathrm{C}$ and 160 MHz for ${ }^{31} \mathrm{P}$ ) or a Bruker Avance 400 NMR (operating at 400 MHz for ${ }^{1} \mathrm{H}, 56 \mathrm{MHz}$ for ${ }^{9} \mathrm{Be}$ and 100 MHz for ${ }^{13} \mathrm{C}$ ) spectrometer. Chemical shifts ( $\delta$ ) are reported in ppm and internally referenced to the carbon nuclei $\left({ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}\right)$ or residual protons $\left({ }^{1} \mathrm{H}\right)$ of the solvent. Microanalyses (C, H, N, S) were performed on an Elementar vario MICRO cube elemental analyzer. Note: both elemental analyses and HRMS were carried out for all new compounds but in some cases these decomposed too rapidly and only one type of analysis was possible.

1,2-Dibromobenzene was purchased from abcr and used as received. [ $\left.\left(\mathrm{Et}_{2} \mathrm{O}\right) \mathrm{BeBr}_{2}\right],{ }^{1} \mathrm{CAAC}^{\mathrm{Me}}$ (1-(2,6-diisopropylphenyl)-3,3,5,5-tetramethylpyrrolidin-2-ylidene), ${ }^{2-3}$ PMe ${ }^{4}{ }^{4}$ SIMes (1,3-bis(2,4,6-trimethylphenyl)-4,5-dihydroimidazol-2-ylidene), ${ }^{5} \quad$ IDipp ((1,3-bis(2,6-diisopropylphenyl)imidazol-2-ylidene), ${ }^{6} \quad\left[\left(\mathrm{Me}_{3} \mathrm{P}\right)_{2} \mathrm{BeBr}_{2}\right],{ }^{7} \quad\left[(\mathrm{IDipp}) \mathrm{BeBr}_{2}\right],{ }^{8} \quad$ 2,2'dibromobiphenyl, ${ }^{9}$ and 2,2'-dilithiobiphenyl ${ }^{10}$ were synthesized following literature procedures.

CAUTION: Beryllium and its compounds are extremely toxic. Suitable precautions (e.g., use of protective clothing, breathing apparatus, well-ventilated fume cupboard, special hazards labelling, special waste disposal measures) were taken for all manipulations involving these species. ${ }^{11}$

2,2'-Dilithiobiphenyl ( $62.8 \mathrm{mg}, 378 \mathrm{mmol}, 1.20$ equiv.) and $\left[\left(\mathrm{Et}_{2} \mathrm{O}\right)_{2} \mathrm{BeBr}_{2}\right](100 \mathrm{mg}$, $315 \mathrm{mmol}, 1.00$ equiv.) were dissolved in toluene ( 50 mL ). After stirring for three days at room temperature the colourless suspension was filtered and all volatiles were removed from the filtrate in vacuo. The beige residue was then washed with diethyl ether ( $3 \times 10 \mathrm{~mL}$ ) to yield $\mathbf{1}$ as a colourless solid ( $43.0 \mathrm{mg}, 183 \mathrm{mmol}, 58 \%$ ). ${ }^{1} \mathrm{H}$ NMR ( $500.1 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}$ ): $\delta=8.07(\mathrm{~d}$, $\left.2 \mathrm{H},{ }^{3} \mathrm{~J}=7.0 \mathrm{~Hz}, \mathrm{CH}_{\alpha}\right), 7.10\left(\mathrm{~d}, 2 \mathrm{H},{ }^{3} J=7.6 \mathrm{~Hz}, \mathrm{CH}_{\alpha}\right), 7.30\left(\mathrm{t}, 2 \mathrm{H},{ }^{3} J=7.6 \mathrm{~Hz}, \mathrm{CH}_{\beta}\right), 7.16(\mathrm{t}$, $\left.2 \mathrm{H},{ }^{3} J=7.0 \mathrm{~Hz}, \mathrm{CH}_{\beta}\right), 6.38\left(\mathrm{q}, 4 \mathrm{H},{ }^{3} J=7.0 \mathrm{~Hz}, \mathrm{CH}_{2}\right.$-Et2O), $0.61\left(\mathrm{t}, 6 \mathrm{H},{ }^{3} \mathrm{~J}=7.0 \mathrm{~Hz}, \mathrm{CH}_{3}\right.$-Ero) ppm. ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR $\left(125.8 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta=158.4\left(C_{\mathrm{q} \text {-BiPh }}\right) 156.4\left(C_{\mathrm{q}-\mathrm{BiPh}}\right), 142.5\left(\mathrm{CH}_{\alpha}\right)$, $128.5\left(\mathrm{CH}_{\beta}\right), 125.3\left(\mathrm{CH}_{\beta}\right), 121.4\left(\mathrm{CH}_{\alpha}\right), 67.4\left(\mathrm{CH}_{2}\right.$-Et2O), $13.0\left(\mathrm{CH}_{3}\right.$-Et2O) ppm. ${ }^{9} \mathrm{Be}$ NMR (56.2 $\left.\mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}\right): \delta=10.8(\mathrm{fwmh} \approx 120 \mathrm{~Hz}) \mathrm{ppm}$. $\mathbf{1}$ ( $100 \mathrm{mg}, 425 \mathrm{mmol}, 1.00$ equiv.) was dissolved in benzene ( 10 mL ) and CAAC ( $121 \mathrm{mg}, 425$ $m \mathrm{~mol}, 1.00$ equiv.) was added. ## X-ray crystallographic details

The crystal data of 7 were collected on a BRUKER X8-APEX II diffractometer with a CCD area detector and multi-layer mirror monochromated Мока radiation. The crystal data of $\mathbf{1 , 2 , 3}, 4$ and 6 were collected on a BRUKER D8-QUEST diffractometer with a CPA area detector and multi-layer mirror monochromated Мока radiation. The crystal data of $\mathbf{5}$ and $\mathbf{8}$ were collected on a Rigaku XtaLAB Synergy-R diffractometer with a HPA area detector and multi-layer mirror monochromated $\mathrm{Cu}_{\mathrm{K} \alpha}$ radiation. The structures were solved using the intrinsic phasing method, ${ }^{12}$ refined with the ShelXL program ${ }^{13}$ and expanded using Fourier techniques. All nonhydrogen atoms were refined anisotropically. Hydrogen atoms were included in structure factor calculations. All hydrogen atoms were assigned to idealised geometric positions.

X-ray data are available free of charge from the Cambridge Crystallographic Data Centre under reference numbers CCDC 2253157 (1), 2253158 (6), 2253159 (3), 2253160 (7), 2253161 (8), 2253162 (4), 2253163 (5), 2253164 (2).

Refinement details for 1: The asymmetric unit contained a partially occupied and highly disordered diethyl ether molecule located on the intersection of all the rotational axes, which could not be modelled satisfactorily and was therefore suppressed with the Platon program SQUEEZE. ${ }^{14} 92$ electrons were thus removed, corresponding to only ca. two $\mathrm{Et}_{2} \mathrm{O}$ molecules per unit cell, i.e. 0.25 per asymmetric unit. The atoms $\mathrm{C} 2, \mathrm{C} 3$ and C 4 of the adducted $\mathrm{Et}_{2} \mathrm{O}$ residue were modelled as twofold disordered (RESI 11 and $12 \mathrm{Et2O}$ ) in a 49:51 ratio. ADPs within the residues were restrained to similarity with SIMU 0.005.

Refinement details for 2: The data showed some twinning but could not be solved satisfactorily as a two- or three-component twin and was integrated as a single domain. Two low-resolution outlying reflections were removed from refinement (011 and 0-1 1). Due to a disorder ( $<5 \%$ ) in one $\mathrm{PMe}_{3}$ group (RESI 4 PHOS), which could not be satisfactorily resolved, the ADPs of P1 and C1 had to be restrained with DELU to avoid Hirschfeld test issues.

Refinement details for 3: The asymmetric unit contains a diethyl ether molecule presenting a 48:52 disorder. The ADP restraints ISOR, SIMU and RIGU were applied to all atoms of this disorder. Nine outlying reflections were omitted.

Refinement details for 4: Both THF ligands were modelled as disordered, one twofold in a 47:53 ratio, the other threefold in a 27:25:48 ratio using the keyword SUMP to add the three free variables up to 1 . The ADP restraints SIMU and RIGU were applied to all atoms of these disorders. The outlying reflections 128 and 204 were omitted.

Refinement details for 5: The asymmetric unit contains two molecules of 5 and a partially occupied molecule (ca. 39\%) of DCM positioned on an inversion centre and modelled as twofold disordered (RESI 5 and 51 DCM) in a 30:9 ratio. ADPs within this disorder were restrained with SIMU 0.005 . 1,2- and 1,3-distances within this disorder were restrained to similarity with SAME. One $\mathrm{CH}_{3}$ group ( C 12 in RESI 4 NHC ) was modelled as twofold rotationally disordered in the three hydrogen atoms and modelled with PART 121 and PART 2 -21 in 51:49 ratio.

Refinement details for 6: The CAAC backbone was modelled as twofold disordered in a 16:84 ratio. The ADP restraints SIMU and RIGU were applied to all atoms of these disorders. The ADPs of the atoms C3_2 and C3_12 were additionally equalised using EADP. The outlying reflections $110,-101$ and -7 18 were omitted.

Refinement details for 7: A low-resolution reflection affected by beamstop [lll $\left.\begin{array}{ll}0 & 2\end{array}\right]$ was removed from refinement.

Refinement details for 8: Refined as a 2-component twin. Component 2 rotated by $179.69741 \%$ around [0.01 1.00-0.00] (reciprocal) or [0.01 1.00-0.00] (direct). The BASF parameter was refined to $28.1 \%$. One $\mathrm{Et}_{2} \mathrm{O}$ residue was modelled as twofold disordered (RESI 6 and 16 ETHE) in a 48:52 ratio. ADPs within this disorder were restrained wit SIMU 0.003.

## Computational details

All calculations were performed using the Gaussian 16, Revision C. $01^{15}$ and the ORCA 5.0.3 ${ }^{16}$ quantum chemistry program packages. Geometry optimisations were performed at the $\omega \mathrm{B} 97 \mathrm{X}$ $\mathrm{D}^{17} / 6-31+\mathrm{G}(\mathrm{d}, \mathrm{p})^{18-25}$ level of theory for i) 7 , ii) a model system of $\mathrm{Li}_{2}[8]$ where the $\mathrm{Et}_{2} \mathrm{O}$ moieties at the alkali metals were removed, and iii) for the bare dianionic $[\mathbf{8}]^{2-}$ system. Vertical and adiabatic singlet-triplet energy gaps were obtained for $\mathrm{Li}_{2}[\mathbf{8}]$ and $[\mathbf{8}]^{2-}$ from single-point calculations at the $(\mathrm{U}) \omega \mathrm{B} 97 \mathrm{X}-\mathrm{D} / 6-311++\mathrm{G}(\mathrm{d}, \mathrm{p})^{26,27}$ level of theory using the appropriate geometries. All optimised geometries were characterised as minima on the corresponding potential energy surfaces by vibrational frequency calculations, which revealed that all eigenvalues in the Hessian matrices are positive.

To assess the biradical/biradicaloid character and the ground-state multiplicity of $\operatorname{Li}_{2}[\mathbf{8}]$ and $[8]^{2-}, 28$ single-point calculations using the complete active space self-consistent field (CASSCF) ${ }^{29}$ method and broken-symmetry DFT (BS-DFT) were performed. The ma-def2TZVP ${ }^{30,31}$ basis set was chosen for the CASSCF calculations, which were done in combination with the resolution of identity approximation for coulomb integrals (RI-J) ${ }^{32,33}$ and the numerical chain-of-spheres integration for the Hartree-Fock exchange integrals (COSX). ${ }^{34-36}$ Despite our best efforts, all attempts to optimise the CASSCF wave function of the bare $[8]^{2-}$ system have failed, which prompted us to use BS-DFT for this system instead. The biradical character $y_{0}{ }^{36-}$ 38 was obtained using the natural orbital occupation numbers (NOON) ${ }^{39}$ from either $\operatorname{CASSCF}(2,2)$ or BS-DFT calculations:

$$
\begin{equation*}
y_{0}=1-\frac{\mathrm{ON}_{\mathrm{HONO}}-\mathrm{ON}_{\mathrm{LUNO}}}{1+\left(\frac{\mathrm{ON}_{\mathrm{HONO}}-\mathrm{ON}_{\mathrm{LUNO}}}{2}\right)^{2}} \tag{S1}
\end{equation*}
$$

where ONHono and ONluno are the occupation numbers of the highest occupied natural orbital (HONO) and the lowest unoccupied natural orbital (LUNO). Plots of the CASSCF active space natural orbitals of $\mathrm{Li}_{2}[\mathbf{8}]$ and the singly-occupied molecular orbitals of $[8]^{2-}$ are shown in Figures S27-28.

To investigate the aromaticity character of $\mathbf{3}, \mathbf{6}$ and $\mathrm{Li}_{2}[\mathbf{8}]$, calculations of the nucleusindependent chemical shift (NICS) $)^{40-42}$ at the $\omega$ B97X-D/6-311++G(d,p) level of theory were
performed. These were accomplished by using the gauge independent atomic orbital (GIAO) ${ }^{43-}$ ${ }^{45}$ method. The corresponding values were obtained by placing dummy atoms in the centres of the different rings and at distances of $0.1 \AA$ along the axis perpendicular to the ring centres. For the NICS $_{z z}$-scan, the zz-component of the magnetic shielding tensor was used. ${ }^{46}$ For the systems containing alkali metals the $\mathrm{NICS}_{z z}$-scan was obtained by calculating the difference of the magnetic shieldings between the full system and the sole metal atoms in the same geometry. Furthermore, the anisotropy of the induced current density (ACID) ${ }^{47-48}$ method at the $\omega$ B97X$\mathrm{D} / 6-311++\mathrm{G}(\mathrm{d}, \mathrm{p})$ level of theory was used to further confirm and support the results.

Finally, the bonding situation of 7 was evaluated by calculations based on the intrinsic bond orbital (IBO) method. ${ }^{49}$ The beryllium-alkene interaction in 7 was also evaluated by distinct bond order analyses, namely Mayer bond order, ${ }^{50}$ fuzzy bond order, ${ }^{51}$ Wiberg bond index, ${ }^{52}$ and natural binding index. ${ }^{53}$ The IBO calculations were performed using the IBOView software, version v20211019-RevA, ${ }^{49,54}$ while the bond order and BS-DFT analyses were done in Multiwfn 3.8. ${ }^{55}$

Natural orbital occupancies (occ.) are shown in parenthesis. Isosurface values $=0.03$.
