1. Computational details

The calculation was performed by using the Gaussian 09 program package¹. The geometric optimization of all the structures and frequency analyses for calculation of heats of formation was carried out by using B3-LYP functional² with 6-311+G** basis set^{3,4}. All of the optimized structures were characterized to be local energy minima on the potential surface without any imaginary frequencies. The heats of formation (HOF) of these compounds were computed through appropriate isodesmic reactions (Scheme S1). All the optimized structures were characterized to be true local energy minima on the potential-energy surface without imaginary frequencies.

Scheme S1 Isodesmic and tautomeric reactions to compute the HOF.

The change of enthalpy for the reactions at 298 K can be expressed as Equation 1

$$\Delta H_{298} = \sum \Delta_f H_P - \sum \Delta_f H_R \quad (\text{Equation 1})$$

where $\sum \Delta_f H_P$ and $\sum \Delta_f H_R$ are the ΔH_f of reactants and products at 298 K, respectively, and ΔH_{298} can be calculated using the following expression:

$$\Delta H_{298} = \Delta E_{298} + \Delta(PV) = \Delta E_0 + \Delta ZPE + \Delta H_T + \Delta nRT \quad (\text{Equation 2})$$

where ΔE_0 is the change in total energy between the products and the reactants at 0 K; ΔZPE is the difference between the zero-point energies (ZPE) of the products and the reactants at 0 K; ΔH_T is thermal correction from 0 to 298 K. The $\Delta(PV)$ value in Equation 2 is the PV work term. It equals $\Delta(nRT)$ for the reactions of ideal gas. For the isodesmic reaction, $\Delta n = 0$, so $\Delta(PV) = 0$. On the left side of Equation 1, apart from target compound, all the others are called reference compounds. The ΔH_f of reference compounds is available either from the experiments or from the high-level computing such as CBS-4M. For the solid phase species, enthalpies of formation $\Delta H_f(s)$ were calculated as follows:

$$\Delta H_{\text{sub}} = aA^2 + b\sqrt{v\sigma_{\text{tot}}^2} + c \quad (\text{Equation 3})$$

$$\Delta H_f(s) = \Delta H_f(g) - \Delta H_{\text{sub}} \quad (\text{Equation 4})$$

ΔH_{sub} = sublimation enthalpy; $\Delta H_f(g)$ = the heats of formation for gas-phase; $\Delta H_f(s)$ = the heats of formation for solid-phase; A = the molecular surface area; a = 0.000267; b = 1.650087; c = 2.966078.

The heats of formation of salts **3** and **5** is calculated as follows:

$$\Delta H_f(\text{salt}, 298 \text{ K}) = \Delta H_f(\text{cation}, 298 \text{ K}) + \Delta H_f(\text{anion}, 298 \text{ K}) - \Delta H_L$$

$$\Delta H_L = U_{\text{POT}} + [p(n_M/2 - 2) + q(n_x/2 - 2)]RT$$

$$U_{\text{POT}} (\text{kJ mol}^{-1}) = \gamma (\rho_m/M_m)^{1/3} + \delta$$

2. The experiment and crystallographic data

Experimental section

Caution! Although we experienced no explosion in handling these energetic materials, the use of small scale and best safety practices (leather gloves, face shield) are strongly encouraged!

Sample preparation

Synthesis of 2, 4 and 6. Aqueous hydroxylamino (1.0 mmol, 0.066g), hydrazine monohydrate (1.0mmol, 0.037 g) or aqueous methylamine (1.0mmol, 0.078 g) was added to the solution of **1** (1.0 mmol, 0.198 g) in methanol, respectively. The reaction mixture was stirred for another 5 h at room

temperature. After filtration, the precipitate was collected and washed with cold methanol and air dried to yield **2**, **4** and **6**.

2: Orange amorphous solid. Yield: 0.181 g, 85.1 %. ¹H NMR (300 MHz, DMSO-d₆): δ= 8.86 (s, 1H) ppm. ¹³C NMR (75 MHz, DMSO-d₆): δ= 148.2, 145.0, 142.8, 120.5 ppm. IR (KBr): ν = 3508, 3414, 3090, 1662, 1589, 1432, 1387, 1224, 1134, 1080, 940, 808, 757, 695, 640 cm⁻¹. Elemental analysis for C₄H₃N₇O₄ (213.11): calcd. C 22.54, H 1.42, N 46.01%; found: C 22.58, H 1.39, N 46.05 %.

4. Red amorphous solid. Yield: 0.171 g, 80.8 %. ¹H NMR (300 MHz, DMSO-d₆): δ= 8.83 (s, 1H), 8.57(s, 2H) ppm. ¹³C NMR (75 MHz, DMSO-d₆): δ= 146.5, 145.0, 142.4, 120.2 ppm. IR (KBr): ν = 3333, 3132, 1576, 1486, 1520, 1323, 1133, 1099, 981, 804, 758, 715, 618 cm⁻¹. Elemental analysis for C₄H₄N₈O₃ (212.13): calcd. C 22.65, H 1.90, N 52.82%; found: C 22.66, H 1.91, N 52.84 %.

6. Yellow amorphous solid. Yield: 0.175 g, 82.9 %. ¹H NMR (300 MHz, DMSO-d₆): δ= 9.95 (s, 1H), 8.99 (s, 1H) 2.99 (s, 3H) ppm. ¹³C NMR (75 MHz, DMSO-d₆): δ= 149.6, 144.5, 143.4, 120.7, 27.9 ppm. IR (KBr): ν = 3090, 1660, 1587, 1495, 1430, 1385, 1163, 1099, 976, 931, 847, 803, 758, 727, 694, 619, 540 cm⁻¹. Elemental analysis for C₅H₅N₇O₃ (211.14): calcd. C 28.44, H 2.39, N 46.44%; found: C 28.40, H 2.41, N 46.45 %.

Synthesis of 3. Aqueous hydroxylamino (1.0 mmol, 0.066 g) was added to the suspension of **2** (1.0 mmol, 0.213 g) in acetonitrile. The reaction mixture was stirred for another 2 h at room temperature. After filtration, the precipitate was collected and washed with cold methanol. Red amorphous solid. Yield: 0.191 g, 89.5 %. ¹H NMR (300 MHz, DMSO-d₆): δ= 8.33 (s, 1H), 7.20 (br, 4H) ppm. ¹³C NMR (75 MHz, DMSO-d₆): δ= 145.4, 142.5, 139.8, 118.6 ppm. IR (KBr): ν = 3421, 3234, 3095, 1657, 1526, 1495, 1320, 1168, 1150, 994, 945, 808, 784, 760, 685, 619, 551 cm⁻¹. Elemental analysis for C₄H₆N₈O₅ (246.14): calcd. C 19.52, H 2.46, N 45.52%; found: C 19.50, H 2.45, N 45.53 %.

Synthesis of 5. Hydrazine monohydrate (1.0 mmol, 0.037 g) was added to the suspension of **4** (1.0 mmol, 0.212 g) in acetonitrile. The reaction mixture was stirred for another 2 h at room temperature. After filtration, the precipitate was collected and washed with cold methanol. Wine-colored solid. Yield: 0.214 g, 87.8 %. ¹H NMR (300 MHz, DMSO-d₆): δ= 8.41 (s, 1H), 7.30 (br, 5H) ppm. ¹³C NMR (75 MHz, DMSO-d₆): δ= 149.7, 146.6, 143.4, 120.8 ppm. IR (KBr): ν = 3333, 3136, 1641, 1572, 1488, 1366, 1340, 1191, 1102, 1049, 964, 853, 802, 773, 715, 616 cm⁻¹. Elemental analysis for C₄H₈N₁₀O₃ (244.18): calcd. C 19.68, H 3.30, N 57.36%; found: C 19.69, H 3.33, N 57.40 %.

General methods

Reagents were purchased from Aldrich and Acros Organics and are used as received. ¹H and ¹³C NMR spectra are recorded on a 300 MHz (Bruker AVANCE 300) NMR spectrometer operating at 300 and 75.0 MHz, respectively. The decomposition points are obtained on a differential scanning calorimeter at a heating rate of 5°C min⁻¹. IR spectra are recorded on a FT-IR spectrometer (Thermo Nicolet AVATAR 370) as thin films by using KBr plates. Densities are determined at 25 °C by employing a Micromeritics AccuPyc II 1340 gas pycnometer. Elemental analyses were carried out by using a Vario Micro cube Elementar Analyser. Impact and friction sensitivity measurements are made by using a standard BAM Fall hammer and a BAM friction tester. Detonation velocity and detonation pressure data are calculated by program package EXPLO5 (version 6.01).

X-ray crystallography

The data for **2**•H₂O, **3** and **6**•H₂O were collected with a Bruker SMART APEX II CCD diffractometer with graphite-monochromated MoKa radiation ($\lambda=0.71073$ nm) or CuKa ($\lambda=1.54178$ nm) at 100 K or 193 K. The data collection and the initial unit cell refinement are performed by using APEX2 (v2010.3-0). Data Reduction is performed by using SAINT (v7.68A) and XPREP (v2008/2). Empirical absorption corrections are applied by using the SADABS (v2008/1) program. The structures are solved by direct methods and refined by the full matrix least-squares based on F2 using SHELXTL--2014/7 (Sheldrick, 2014) programme package. All non-hydrogen atoms were refined anisotropically. The hydrogen atoms attached to ligands are included using a riding model. The crystallographic data and CCDC numbers for these compounds are summarized in **Table S3**
