## 1. General procedures

All procedures described in this paper were performed under a nitrogen or argon atmosphere by use of Schlenk, glovebox and vacuum line techniques or a personal organic synthesiser (EYELA ChemStation PPM-5512). Benzene and tetrahydrofuran (thf) were dried and purified using the Nikko-Hansen Glass Contour Ultimate Solvent System. MeCN was dried over Drierite and distilled under nitrogen. Benzene- $d_6$  and thf- $d_8$  were dried over sodium wire and stored under vacuum, and it was directly transferred into an NMR tube or a 25 ml Schlenk tube by vacuum distillation prior to use.  $[\text{Ru}(\eta^6\text{-naphthalene})(\eta^4\text{-1,5-cod})]$  (**1a**: cod = cyclooctadiene),<sup>1</sup>  $[\text{Ru}(\eta^6\text{-naphthalene})(\eta^4\text{-oxa-bnd})]$  (**1b**: oxa-bnd = 9-oxabicyclo[3.3.1]nona-2,6-diene),<sup>2</sup> 2,5-dialkynylthiophenes (**2a-c**),<sup>3</sup> 2,5-dialkynyl-3-methylthiophene (**2d**),<sup>3</sup> 1,4-di(tetradec-1-yn-1-yl)benzene (**2e**)<sup>3</sup> and 2,5- and 2,6-di(buta-1,3-dien-1-yl)pyridines (**3a-b**)<sup>4</sup> were prepared according to the literature procedures. Other reagents were purchased from commercial suppliers and were used as received.  $^1\text{H}$ ,  $^{13}\text{C}\{^1\text{H}\}$ , and 2-dimensional NMR spectra were measured on a JEOL ECX-400P spectrometer (400 MHz for  $^1\text{H}$ ). MALDI-TOF MS were performed on Bruker Daltonics autoflex III smartbeam or Bruker Ultraflex extreme-TK2. UV-Vis analyses were performed on a JASCO V-650 spectrophotometer. The fluorescence analyses were performed on a JASCO FP-6500 fluorescence spectrophotometer. The CV analyses were performed on a TOHO polarisation unit PS-07. **The GPC analyses were performed on a TOSOH HLC-8320 GPC using tetrahydrofuran as an eluent monitored by refractive index detector.**

## 2. Reaction of 2,5-di(tetradec-1-yn-1-yl)thiophene (**2a**) with 2,5-di(buta-1,3-dien-1-yl)pyridine (**3a**)

**2a** (70.0 mg, 0.149 mmol) and **3a** (27.4 mg, 0.150 mmol) in thf (1.8 ml) were added to a test tube under a nitrogen atmosphere. To the solution was added  $[\text{Ru}(\eta^6\text{-naphthalene})(\eta^4\text{-oxa-bnd})]$  (**1b**) (5.2 mg, 0.015 mmol; 10 mol%) as a catalyst. The test tube was capped with a silicone septum and the mixture was allowed to react at 30 °C for 3 d using a personal organic synthesiser. The reaction mixture was then concentrated and purified by reprecipitation with methanol to obtain a purple powder (72.2 mg) in 74% yield. This product was soluble to thf and was characterised by  $^1\text{H}$  NMR (Fig. S1)  $^1\text{H}$ - $^1\text{H}$

COSY experiment (Fig. S3),  $^{13}\text{C}\{^1\text{H}\}$  NMR (Fig. S4) and MALDI-TOF MS (Fig. S5). The dominant product was characterised as **4aa** but small amount of isomer **4aa'** was observed in the  $^1\text{H}$  NMR (**4aa/4aa'** = 8/1). Although the detailed structure of **4aa'** is less clear, we tentatively characterised as a regioisomer based on the unsymmetric **3a**.  $^1\text{H}$  NMR showed no traces of Ru complexes such as diene complex and cyclooctadienyl complex, but no further analysis of Ru contamination was carried out.

In the  $^1\text{H}$  NMR spectrum, very small amount of resonances assignable to the terminal protons have been observed (Fig. S1-2). For comparison, a  $^1\text{H}$  NMR spectrum of the same region of **3a** is shown in Fig. S2. In Fig. S1-2, the terminal proton at 2-butadienyl group has almost disappeared and only the terminal protons at 5-butadienyl group were observed at 5.16 and 5.35 ppm. This polymer has the mass number of multiple of repeating units (MS = 652.08) with the pyridyl end (MS = 182.25) by MALDI-TOF MS spectroscopy (Fig. S5). From this fact, we have considered the terminal chain end group of polymer **4a** is the 5-butadienyl group on pyridyl ring.

The mixture was allowed to react at 30 °C for 3 d. The reaction mixture was concentrated and purified by reprecipitation with methanol to obtain a red solid of **4ba** (14.9 mg) in 51% yield. This product was characterised by NMR and MALDI-TOF MS.

## 15. UV-Vis measurements

The UV-Vis spectra of **4aa**, **4ab** and **7<sup>s</sup>** were measured in a spectroscopic grade thf solution (or acetone) using a quartz cell (cell length = 1.0 cm) at the concentration of 0.010 mM.

## 16. Fluorescence measurements

The fluorescence spectra of **4aa**, **4ab** and trimer **7** were measured in a spectroscopic grade thf solution using a quartz cell (cell length = 1.0 cm) at the concentration of 0.10 mM at room temperature. Although the excitation spectra of **4aa**, **4ab** and **7** were measured, no peaks were observed due to poor signal-to-noise ratio. These optimum excitation wavelengths were therefore screened for wavelengths giving the strongest fluorescence intensity in the range of 350-550 nm at room temperature. As the result, the optimum excitation wavelengths for **4ab** and **7** were found to be 400 nm. On the other hand, no significant fluorescence was observed for **4aa** by excitation in these wavelength range but that excited at 400 nm was depicted in Figure 3.

## 17. Cyclic voltammetry

The CV spectra of **4aa**, **4ab** and **7** (1.0 mM) were recorded in a spectroscopic grade thf solution at the Pt electrodes with [Bu<sub>4</sub>N][ClO<sub>4</sub>] (0.1 M) as the supporting electrolyte at a sweep rate of 10 mVs<sup>-1</sup>. Pt was employed as the working electrode, and the potential scale was corrected with the standard redox potential of ferrocene ( $E^\circ = +0.380$  V).

## 18. MALDI-TOF MS

The MALDI-TOF MS of conjugated compounds were measured with trans-2-[3-(4-tert-Butylphenyl)-2-methyl-2-propenylidene]malononitrile (DTCB) by linear positive mode.

## 19. GPC measurements

The GPC measurements of **4aa** and **4ab** were performed at 40 °C using tetrahydrofuran as the eluent at a flow rate of 0.35 ml/min. The polymer solution was prepared at the saturation concentration of tetrahydrofuran (approx. 2 mg in 2 ml) followed by filtration through a polytetrafluoroethylene filter. The calibration was made by use of polystyrene standard (Tosoh Corporation).
