## Materials and methods

### Construction of hemi-spherical gas flow spectroscopic mini-chamber for *in situ* time-dependent ATR-FTIR spectroscopy in controlled atmosphere

The hemispherical body of the spectroscopic mini-chamber was fabricated from a template: transparent acrylic dome (plastic hemisphere) 1" diameter (from Supremetech), Figure S1. First, the through hole was drilled at the center of the top of the template, to accommodate pushing the screw of the ATR assembly. Then, the template was inverted, its internal volume was filled with liquid colorless transparent epoxy mixed with hardener (Dr. Resin brand), then stainless steel sapphire anvil (Specac product GS10531) was placed inside epoxy with hardener with its tip up. The epoxy with hardener was leveled to edges of the template, to make the empty internal volume of the spectroscopic mini-chamber of only few cubic millimeters. The epoxy was allowed to solidify for 24 hours. Then, two holes were drilled through the front and rear sides of the obtained spectroscopic mini-chamber, and two pieces of soft silicone tubing (1/16" ID x 1/8" OD) were inserted to the holes, to make gas inlet port (item 4 in Figure 3) and gas outlet port (item 5 in Figure 3). Gas inlet port and gas outlet port can be used interchangeably. To ensure gas tightness between the spectroscopic mini-chamber and the ATR baseplate, flat adhesive mini O-ring was cut from soft silicone adhesive sheet 1 mm thick (hardness 50 Durometer), this O-ring was placed between the spectroscopic mini-chamber and the ATR baseplate, and the ATR bridge assembly was locked.
