**A larger basis set describes atomization energy core-valence correction better than
a higher-order coupled-cluster method**

Extrapolation Techniques

In addition to using finite basis sets, we extrapolated the correlation energies to the complete basis set (CBS) limit using three different methods (**e1–e3**) as described below.

e1: The correlation energy is assumed to converge as $E_X = E + AX^{-3}$ (widely known as the Helgaker formula¹), where E_X stands for the correlation energy obtained with the basis set cardinal number X, E is the CBS limit energy, and A is a system-specific constant. The present formula was used for the two-point extrapolation of the total correlation energy for each considered coupled-cluster method.

e2: The following more flexible form was used: $E_X = E + AX^{-\beta}$, where β is a constant specific for a given pair of cardinal numbers, X and X + 1. Initially, this constant was derived for the two-point 2/3 ($\beta = 2.46$) and 3/4 ($\beta = 3.05$) extrapolations for the SD(T)/nZ level.² We optimized this exponent for the 4/5 ($\beta = 3.22$) extrapolation by performing the 3/4/5 three-point extrapolations for all available SD(T)/nZ ($n = T, Q, 5$) data and taking the median value. The described exponents were used for extrapolation of the SD- and SD(T)-level correlation energies. The higher-order increments were extrapolated separately using the same formula but specifically derived exponents: 2.7174 (2/3, SDT–SD(T)), 2.9968 (2/3, SDT(Q)–SDT), 1.7139 (2/3, SDTQ–SDT(Q)), 2.4807 (3/4, SDT–SD(T)), 3.3831 (3/4, SDT(Q)–SDT), and 2.6072 (3/4, SDT(Q)–SDT).³ There are no exponents optimized for higher contributions (SDTQ(P)–SDTQ and SDTQP–SDTQ(P)), so we assumed that these increments were sufficiently converged at the TZ level. The final extrapolated energy was then taken as the sum of the extrapolated SD(T)-level energies, extrapolated SDT–SD(T), SDT(Q)–SDT, and SDTQ–SDT(Q) increments (each with a specific exponent), and the SDTQP/TZ – SDTQ/TZ quantity. The extrapolations for the augmented basis sets were performed similarly, with the only difference in the 2/3 exponent ($\beta = 2.51$) for the SD(T)/anZ level.²

e3: This is the recent extrapolation technique based on the Riemann zeta function.⁴ The key formula is $E = E_L + L^4(E_L - E_{L-1})(\frac{\pi^4}{90} - \sum_{l=1}^L l^{-4})$, where E_L is the correlation energy obtained with the basis set cardinal number L, and E is the exact energy. This two-point extrapolation method does not require the

determination of any additional L-specific constants. This technique was applied to the full correlation energies for each considered coupled-cluster method, as in the **e1** method.

For clarity, the abbreviation “eN{X,Y}Z” was used throughout the text, where eN represents the type of the two-point extrapolation (**e1–e3**), while XZ and YZ are two consecutive basis sets used for this extrapolation.

The extrapolated energies can be represented as a linear combination of finite basis set energies in all cases (**e1–e3**). Therefore, when the reaction energies are of interest (e.g. total atomization energy), there is no difference in whether they are extrapolated directly or the energies of the individual systems are extrapolated first and then subtracted.

The extrapolation of the Hartree-Fock energy was performed similarly for all methods (**e1–e3**) by using $E_X = E + A \exp(-\alpha X^{1/2})$ formula with fitted values of α (4.42 for 2/3 and 5.46 for 3/4 extrapolation).²

Batch #1

Table S1. Absolute deviations of core-valence corrections to the atomization energy from reference values in kcal mol⁻¹. Reference values (REFERENCE) are computed as the mean of SD(T)/eN{Q,5}Z (N = 1 – 3) values. The range of SD(T)/eN{Q,5}Z (N = 1 – 3) values (RANGE, RMS = 0.0094 kcal mol⁻¹) and the absolute deviations for a given coupled-cluster method and basis set (including extrapolated results) are shown. Color encoding shows the highest (red) and the lowest (green) values. Maximum (MAX), mean (MAD), root mean square (RMS), and standard deviation (SD) are provided at the bottom of the Table.

Table S2. Differences between absolute deviations obtained at given levels of theory in kcal mol⁻¹. Reference values are computed as the mean of SD(T)/eN{Q,5}Z (N = 1 – 3) values. Positive values are highlighted in red. Maximum (MAX), mean (MAD), root mean square (RMS), and standard deviation (SD) are provided at the bottom of the Table.

System	SD(T)/DZ – SD/TZ	SD(T)/TZ – SD/QZ	SD(T)/QZ – SD/5Z	SD(T)/e1{D,T}Z – SD/e1{T,Q}Z	SD(T)/e1{T,Q}Z – SD/e1{Q,5}Z	SD(T)/e2{D,T}Z – SD/e2{T,Q}Z	SD(T)/e2{T,Q}Z – SD/e2{Q,5}Z	SD(T)/e3{D,T}Z – SD/e3{T,Q}Z	SD(T)/e3{T,Q}Z – SD/e3{Q,5}Z

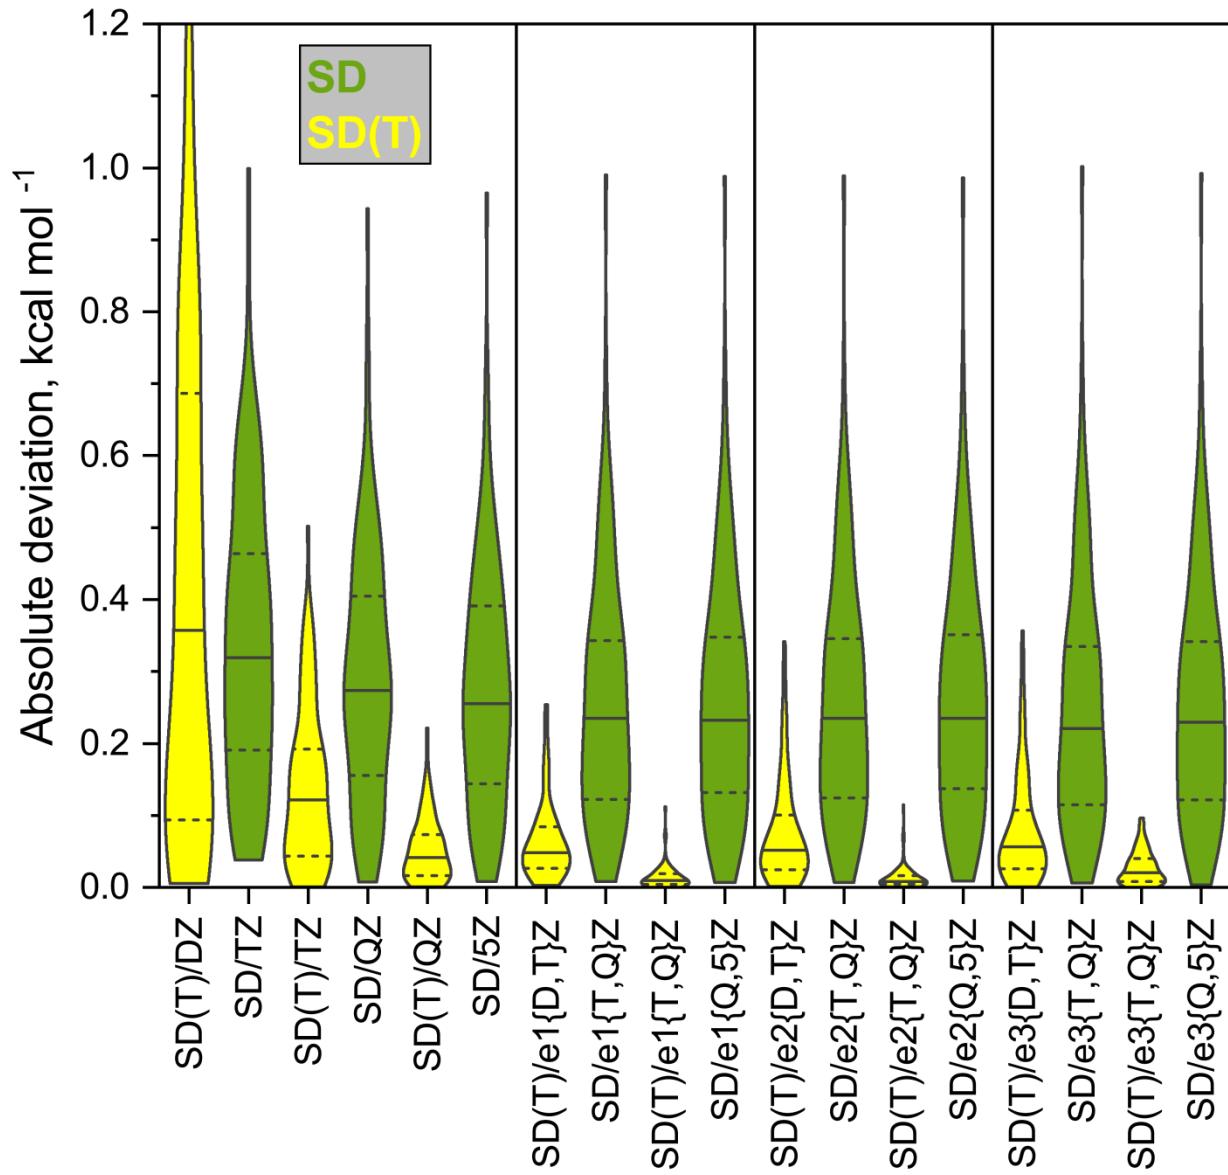

Figure S1. Violin plots of the absolute deviations obtained at a given level of theory. Reference values are computed as the mean of $\text{SD}(\text{T})/\text{eN}\{\text{Q},5\}\text{Z}$ ($N = 1 - 3$) values. The median (solid), 25th, and 75th percentiles (dash) are shown. The highest point of a plot represents the maximum deviation.

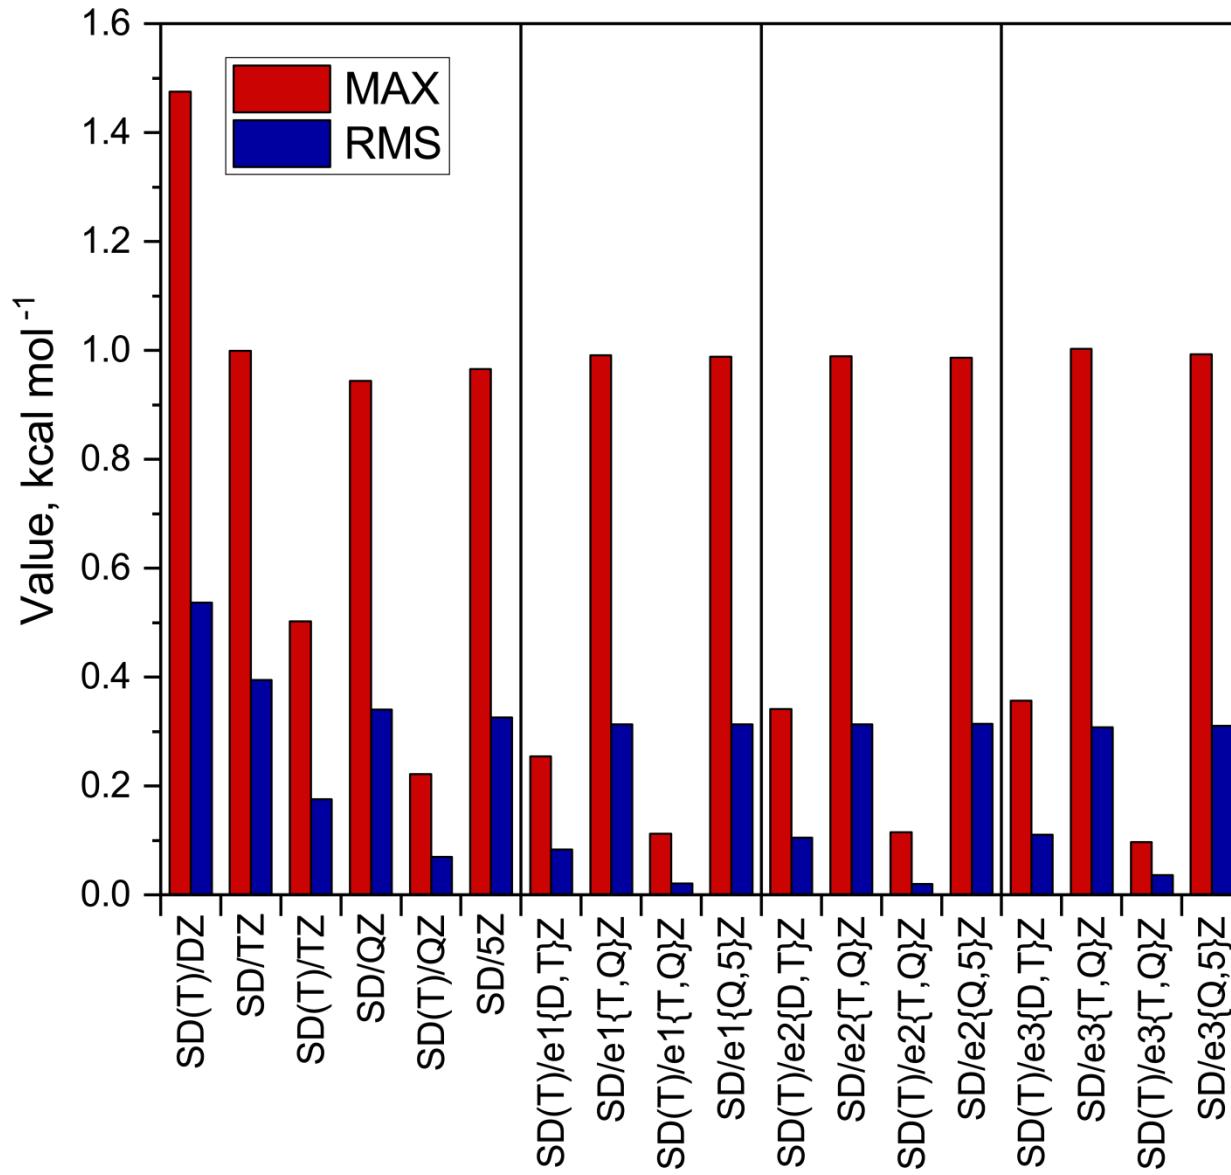

Figure S2. Maximum (MAX) and root mean square (RMS) values for the absolute deviations obtained at a given level of theory. Reference values are computed as the mean of $\text{SD}(\text{T})/\text{eN}\{\text{Q},5\}\text{Z}$ ($N = 1 - 3$) values.

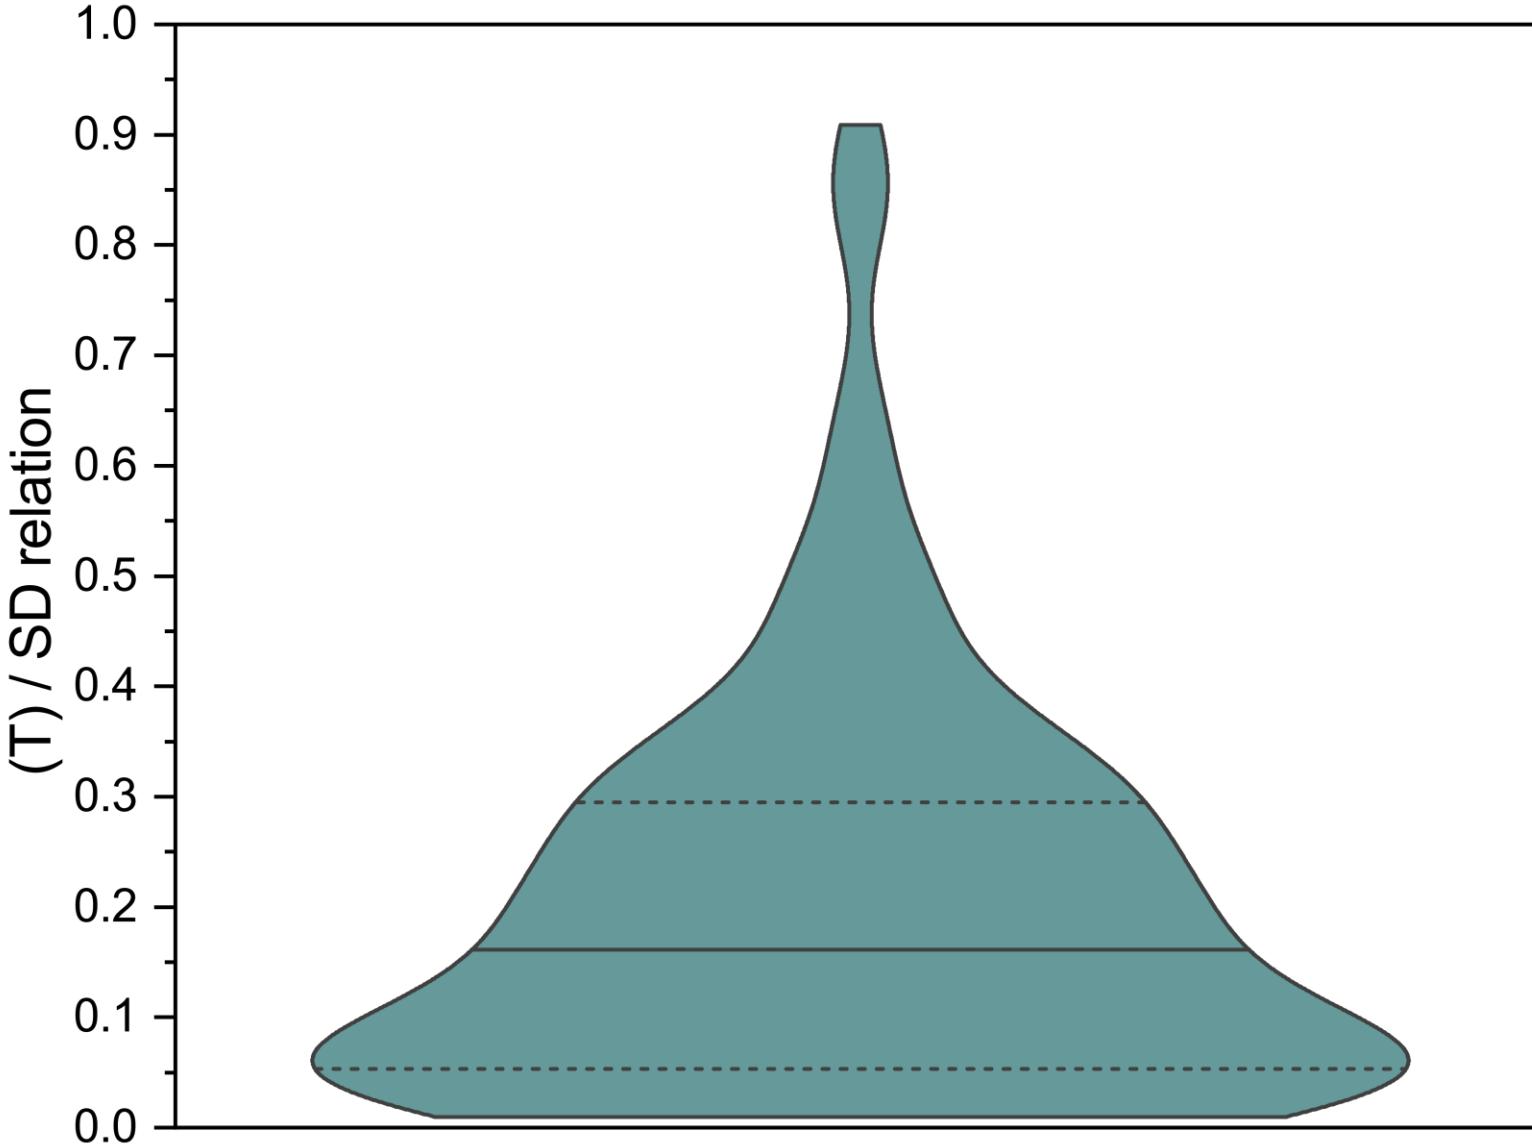

Figure S3. The relations between computational times for perturbative triples and iterative singles and doubles. The times for the FC and CV $\text{SD}(T)/nZ$ ($n = D, T, Q, 5$) computations were combined and used for visualization. Times lower than 1 min were excluded. The median (solid), 25th, and 75th percentiles (dash) are shown.

Batch #2

Table S3. Absolute deviations of core-valence corrections to the atomization energy from reference values in kcal mol⁻¹. Reference values (REFERENCE) are computed as the mean of SDT(Q)/eN{T,Q}Z (N = 1 – 3) values. The range of SDT(Q)/eN{T,Q}Z (N = 1 – 3) values (RANGE, RMS = 0.0114 kcal mol⁻¹) and the absolute deviations for a given coupled-cluster method and basis set (including extrapolated results) are shown. Color encoding shows the highest (red) and the lowest (green) values. Maximum (MAX), mean (MAD), root mean square (RMS), and standard deviation (SD) are provided at the bottom of the Table.

Table S4. Differences between absolute deviations obtained at given levels of theory in kcal mol⁻¹. Reference values are computed as the mean of SDT(Q)/eN{T,Q}Z (N = 1 – 3) values. Positive values are highlighted in red. Maximum (MAX), mean (MAD), root mean square (RMS), and standard deviation (SD) are provided at the bottom of the Table.

System	SDT/DZ – SD(T)/TZ	SDT(Q)/DZ – SD(T)/TZ	SDT/TZ – SD(T)/QZ	SDT(Q)/TZ – SDT/QZ	SDT/e1{D,T}Z – SD(T)/e1{T,Q}Z	SDT(Q)/e1{D,T}Z – SDT/e1{T,Q}Z	SDT/e2{D,T}Z – SD(T)/e2{T,Q}Z	SDT(Q)/e2{D,T}Z – SDT/e2{T,Q}Z	SDT/e3{D,T}Z – SD(T)/e3{T,Q}Z	SDT(Q)/e3{D,T}Z – SDT/e3{T,Q}Z

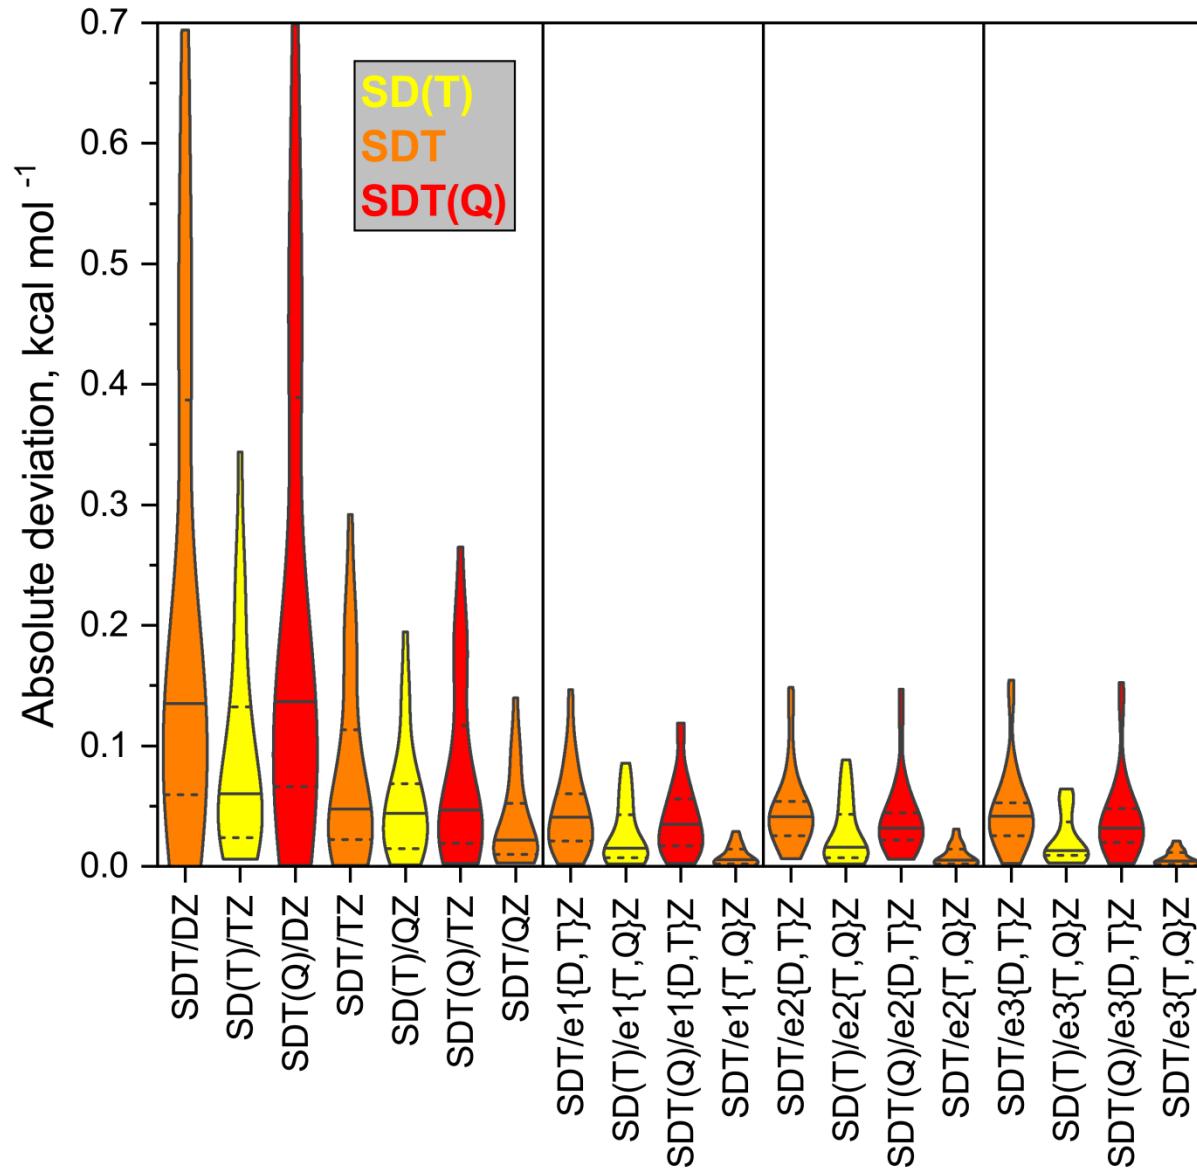

Figure S4. Violin plots of the absolute deviations obtained at a given level of theory. Reference values are computed as the mean of $SDT(Q)/eN\{T,Q\}Z$ ($N = 1 - 3$) values. The median (solid), 25th, and 75th percentiles (dash) are shown. The highest point of a plot represents the maximum deviation.

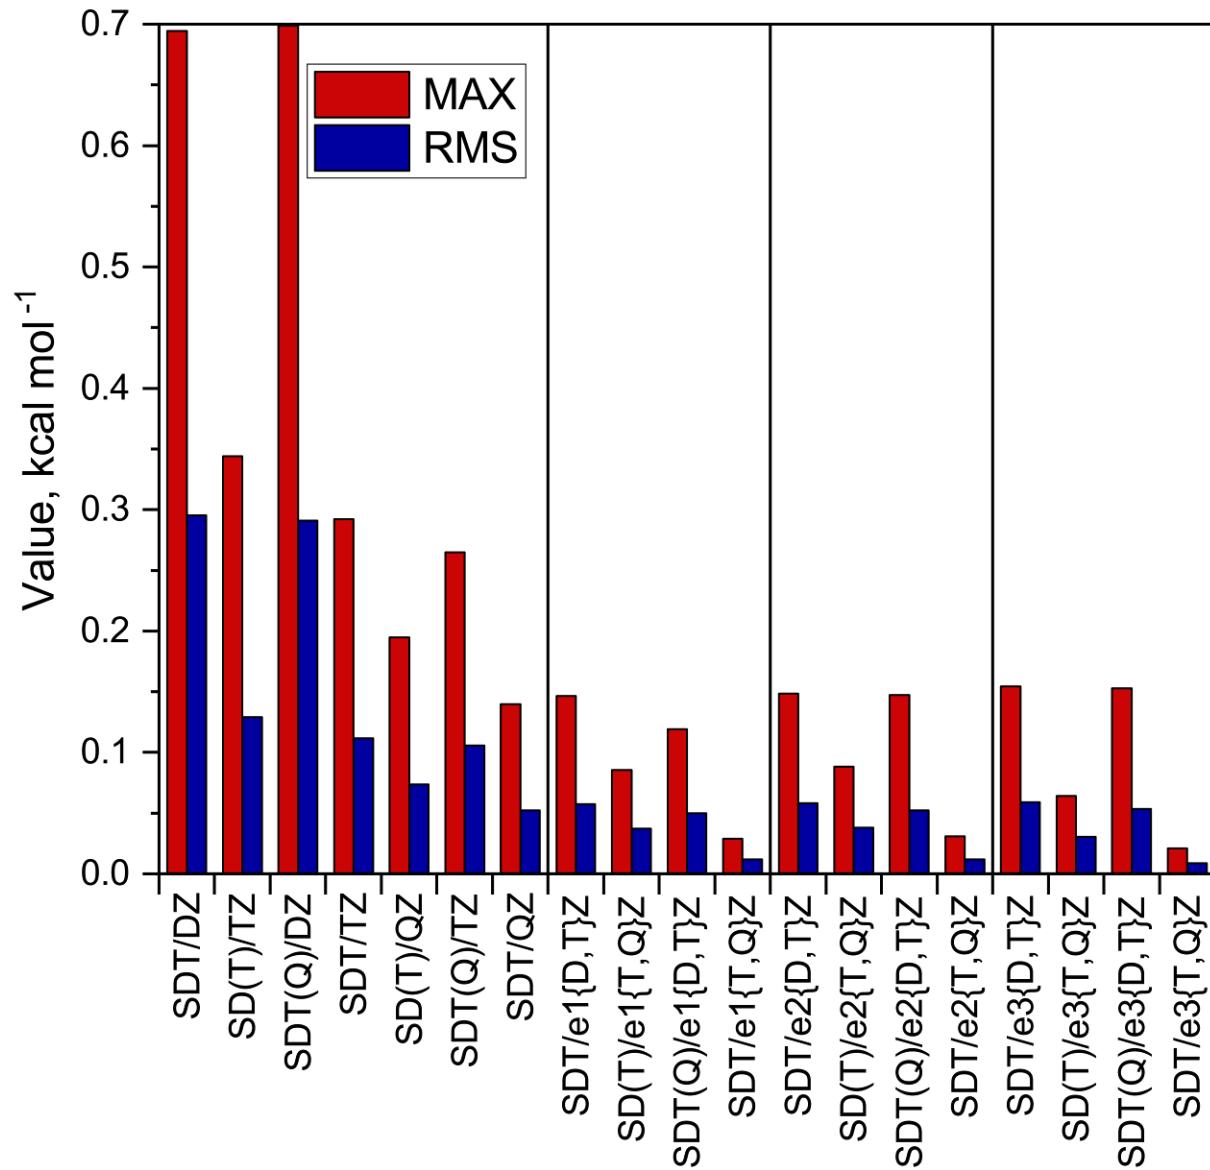

Figure S5. Maximum (MAX) and root mean square (RMS) values for the absolute deviations obtained at a given level of theory. Reference values are computed as the mean of $\text{SDT}(Q)/eN\{T,Q\}Z$ ($N = 1 - 3$) values.

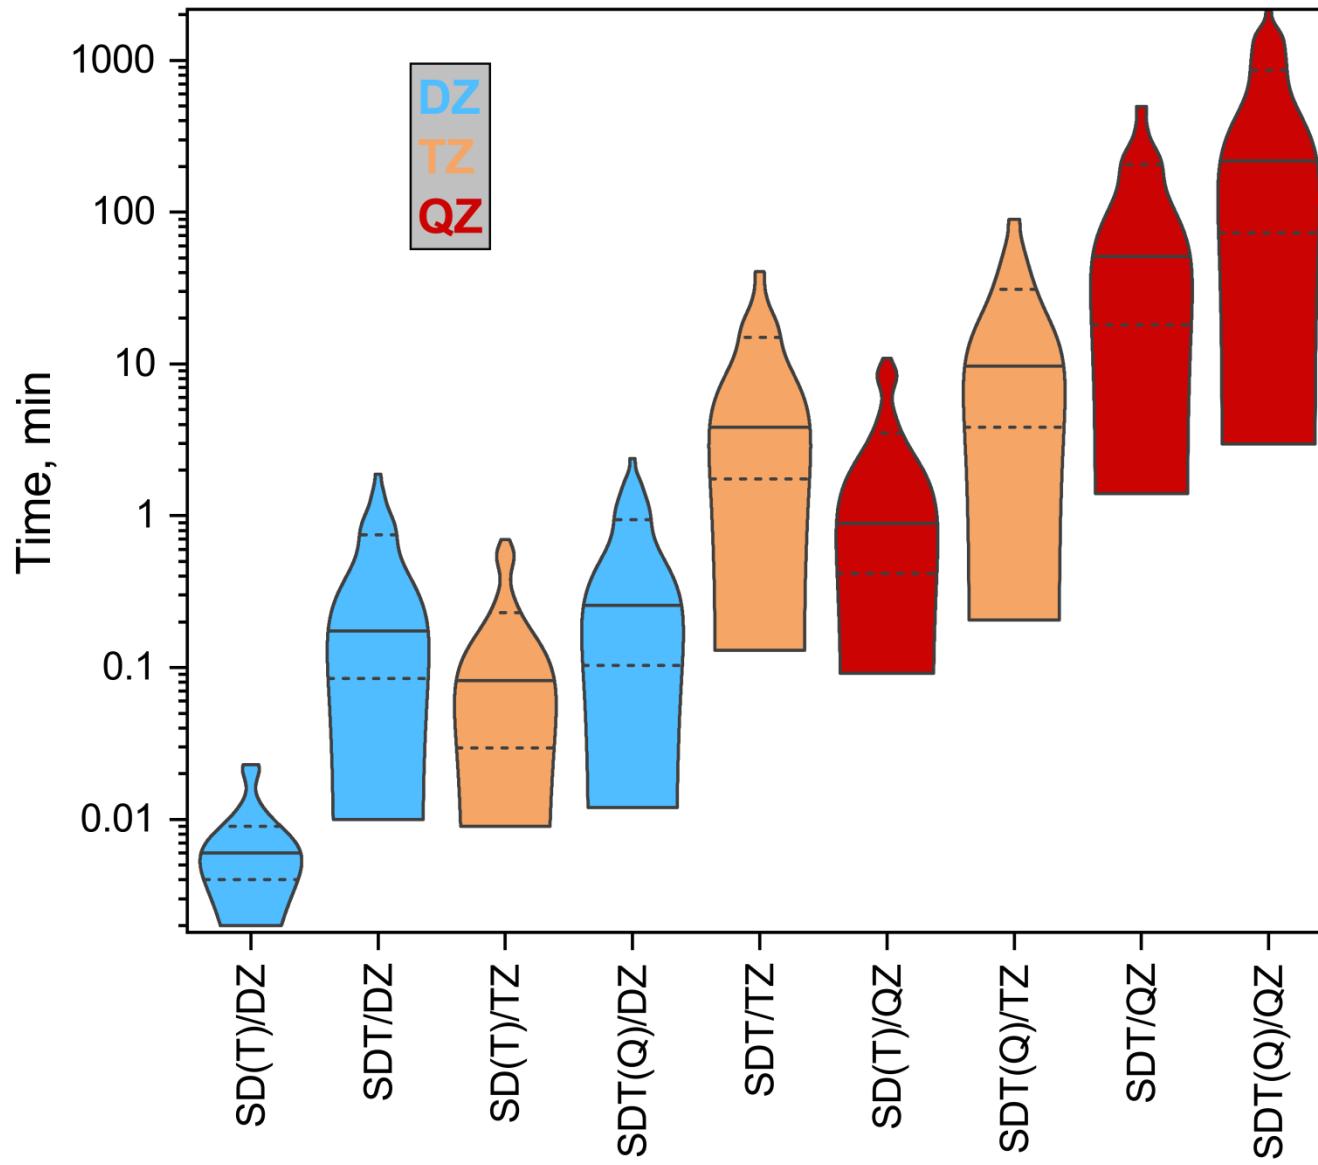

Figure S6. Computational times for different levels of theory. The times for the FC and CV calculations were combined and used for the visualization. The data for the SD(T) method were obtained using the optimized CCSD(T) program “ccsd” for systems for which SDT(Q) computations were performed. The median (solid), 25th, and 75th percentiles (dash) are shown.

Batches #3 and #4

Table S5. Absolute deviations of core-valence corrections to the atomization energy from reference values in kcal mol⁻¹. Reference values (REFERENCE) are computed as the mean of SDTQ(P)/eN{D,T}Z (N = 1 – 3) values. The range of SDTQ(P)/eN{D,T}Z (N = 1 – 3) values (RANGE, RMS = 0.0389 kcal mol⁻¹) and the absolute deviations for a given coupled-cluster method and basis set (including extrapolated results) are shown. Color encoding shows the highest (red) and the lowest (green) values. Maximum (MAX), mean (MAD), root mean square (RMS), and standard deviation (SD) are provided at the bottom of the Table.

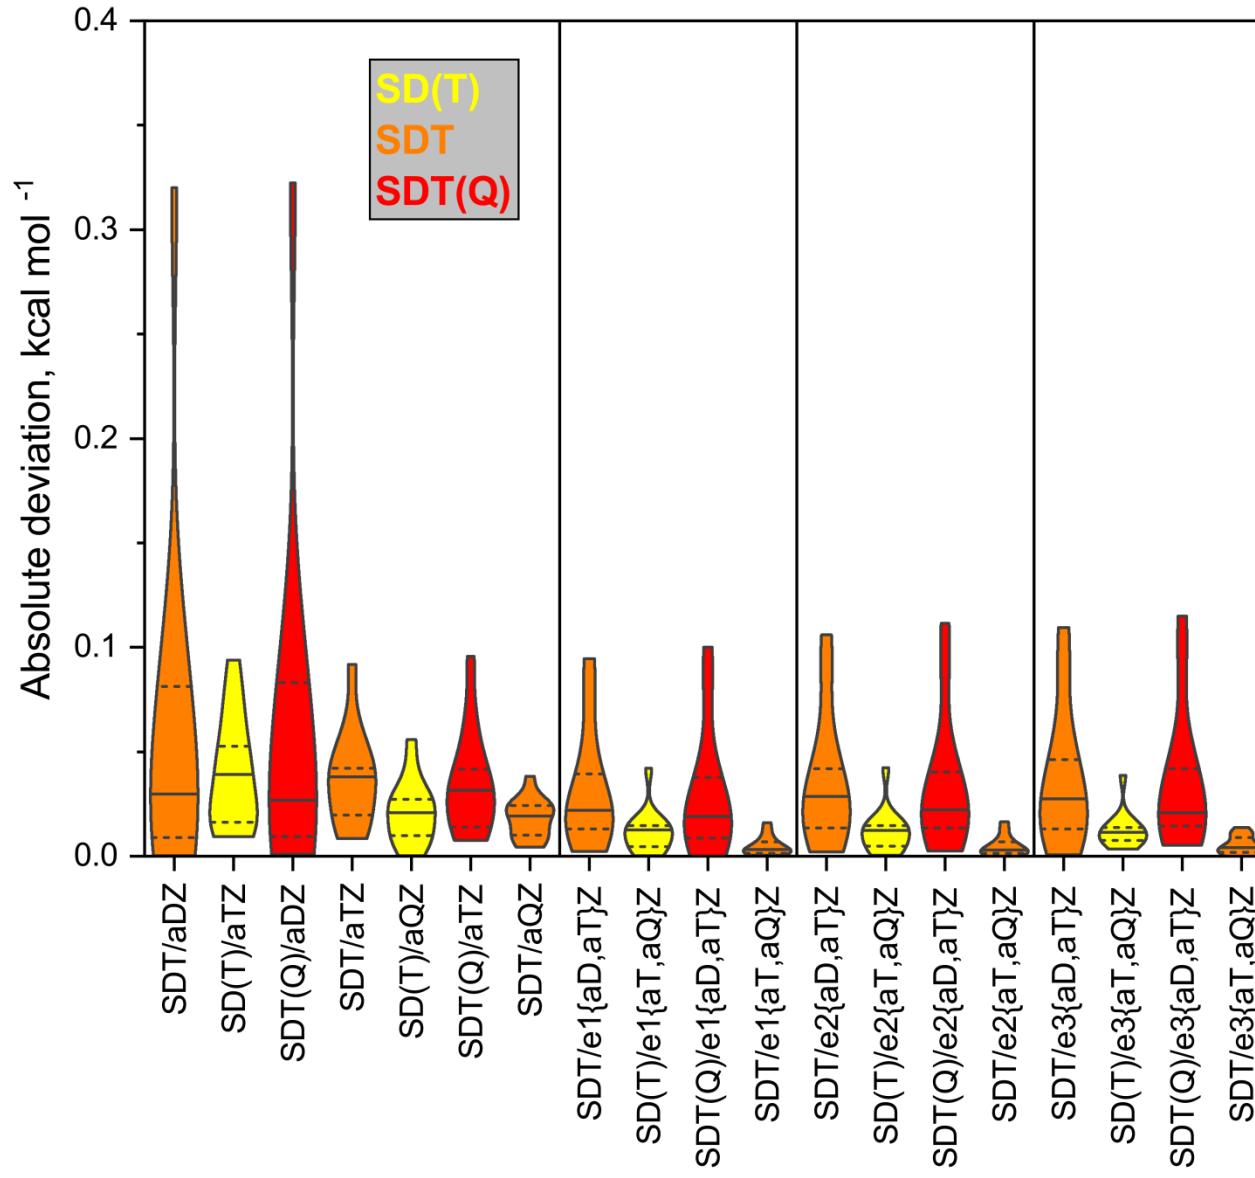

Figure S10. Violin plots of the absolute deviations obtained at a given level of theory. Reference values are computed as the mean of $\text{SDT}(Q)/eN\{aT,aQ\}Z$ ($N = 1 - 3$) values. The median (solid), 25th, and 75th percentiles (dash) are shown. The highest point of a plot represents the maximum deviation.

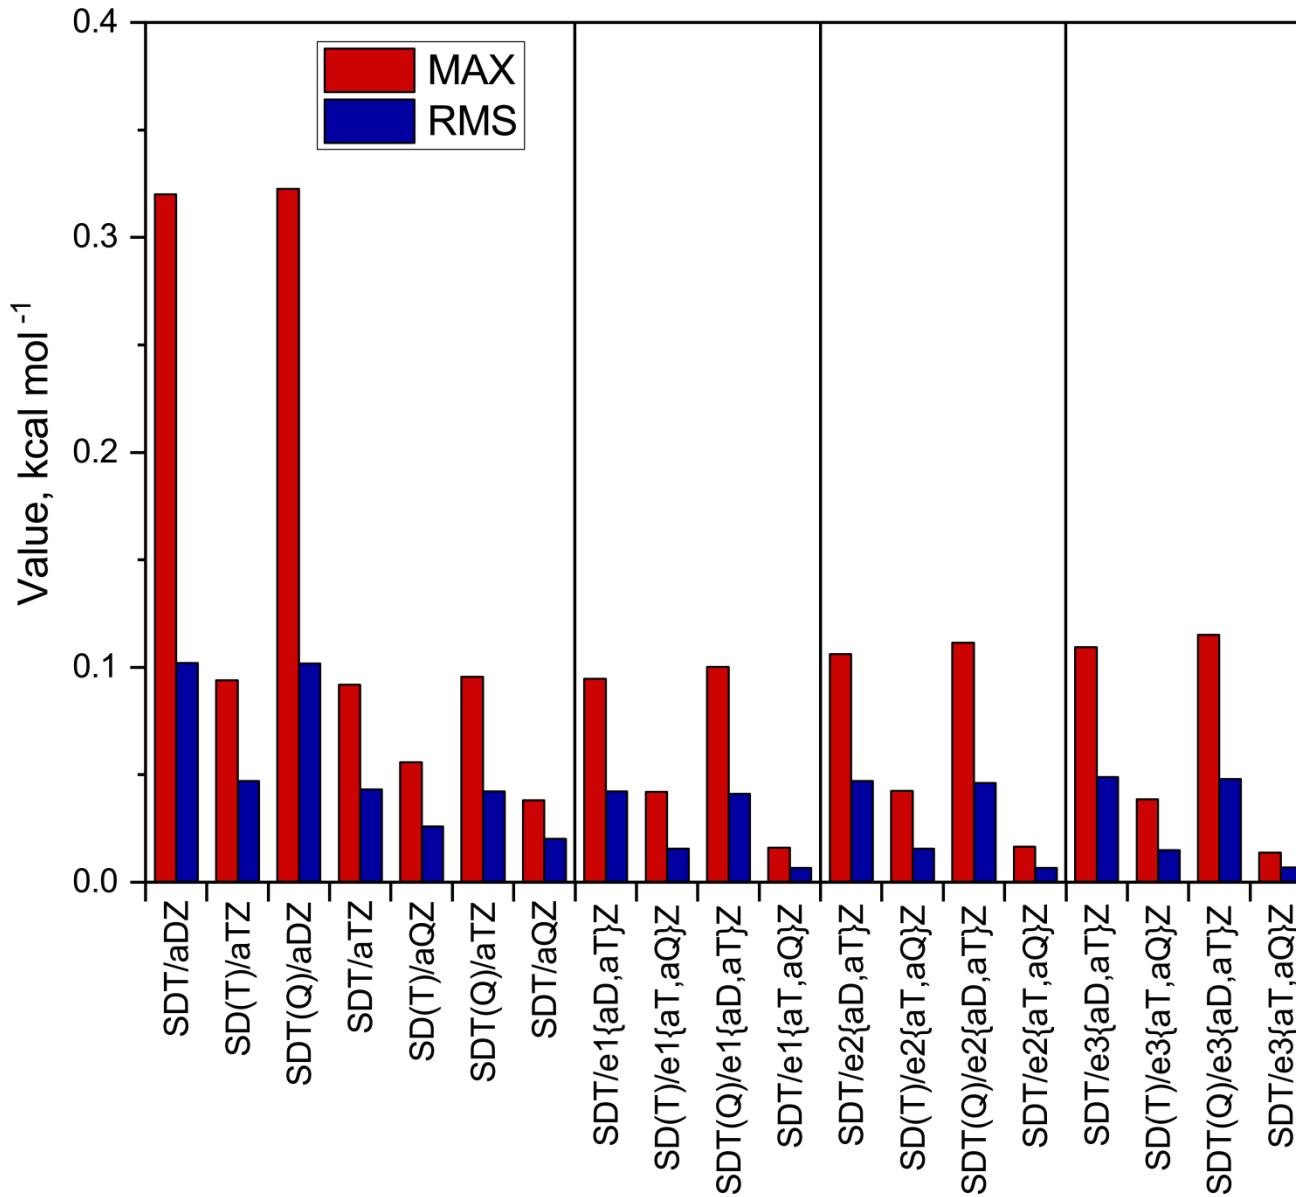

Figure S11. Maximum (MAX) and root mean square (RMS) values for the absolute deviations obtained at a given level of theory. Reference values are computed as the mean of $\text{SDT}(Q)/eN\{\text{aT},\text{aQ}\}Z$ ($N = 1 - 3$) values.

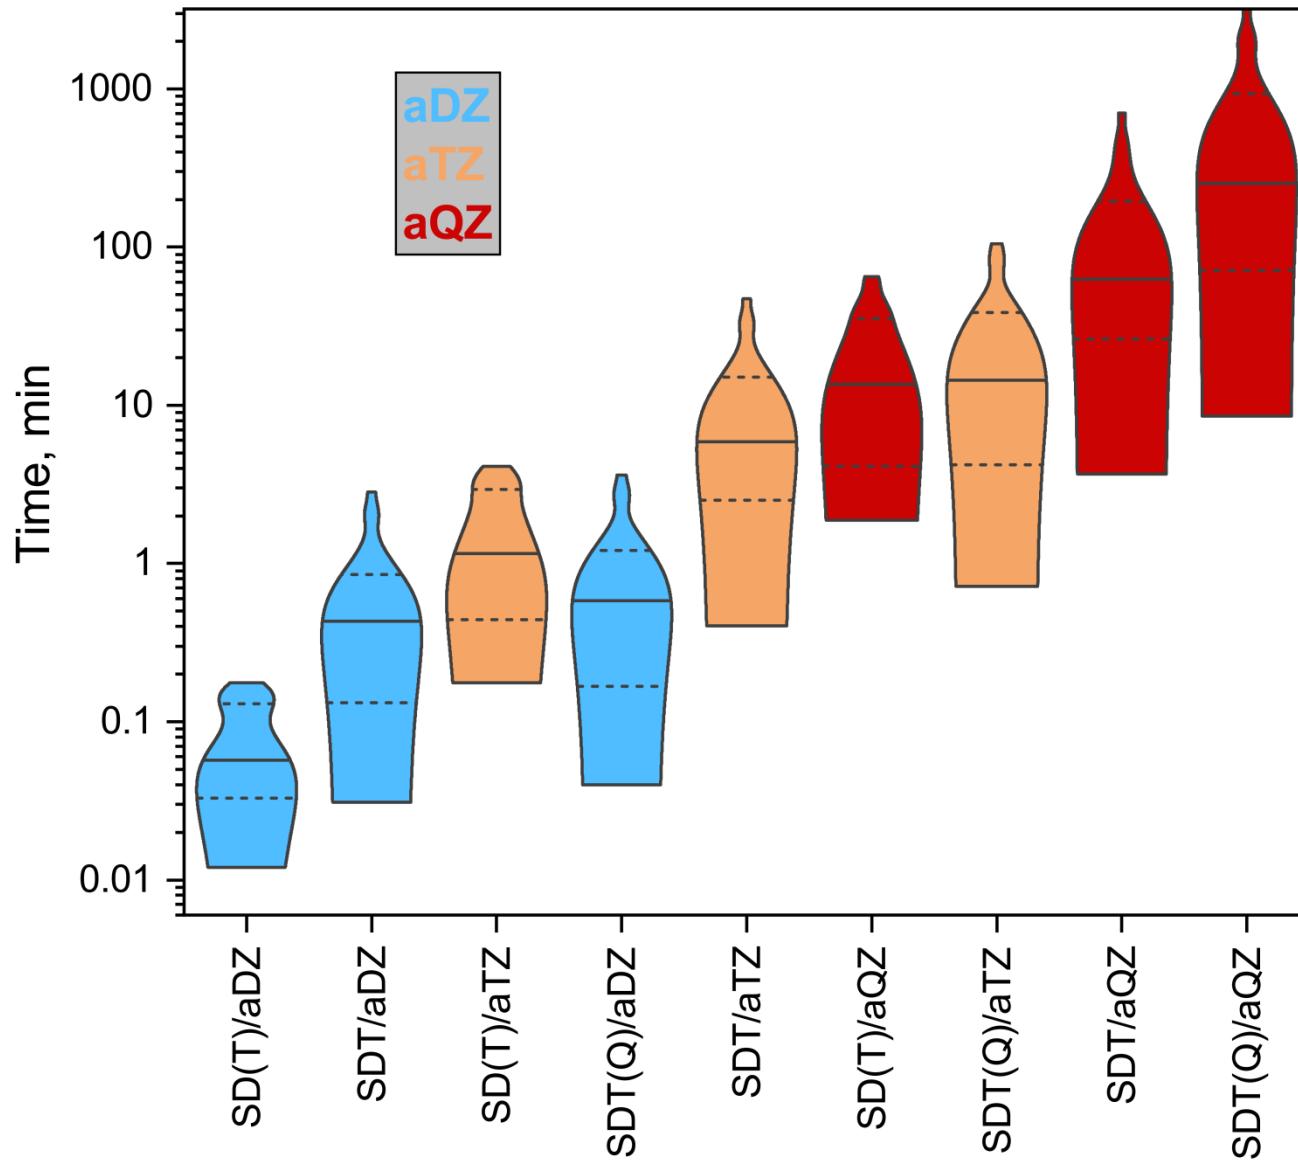

Figure S12. Computational times for different levels of theory. The times for the FC and CV calculations were combined and used for the visualization. The data for the SD(T) method were obtained using the string-based CC program “mrcc” for systems for which SDT(Q) computations were performed. The median (solid), 25th, and 75th percentiles (dash) are shown.

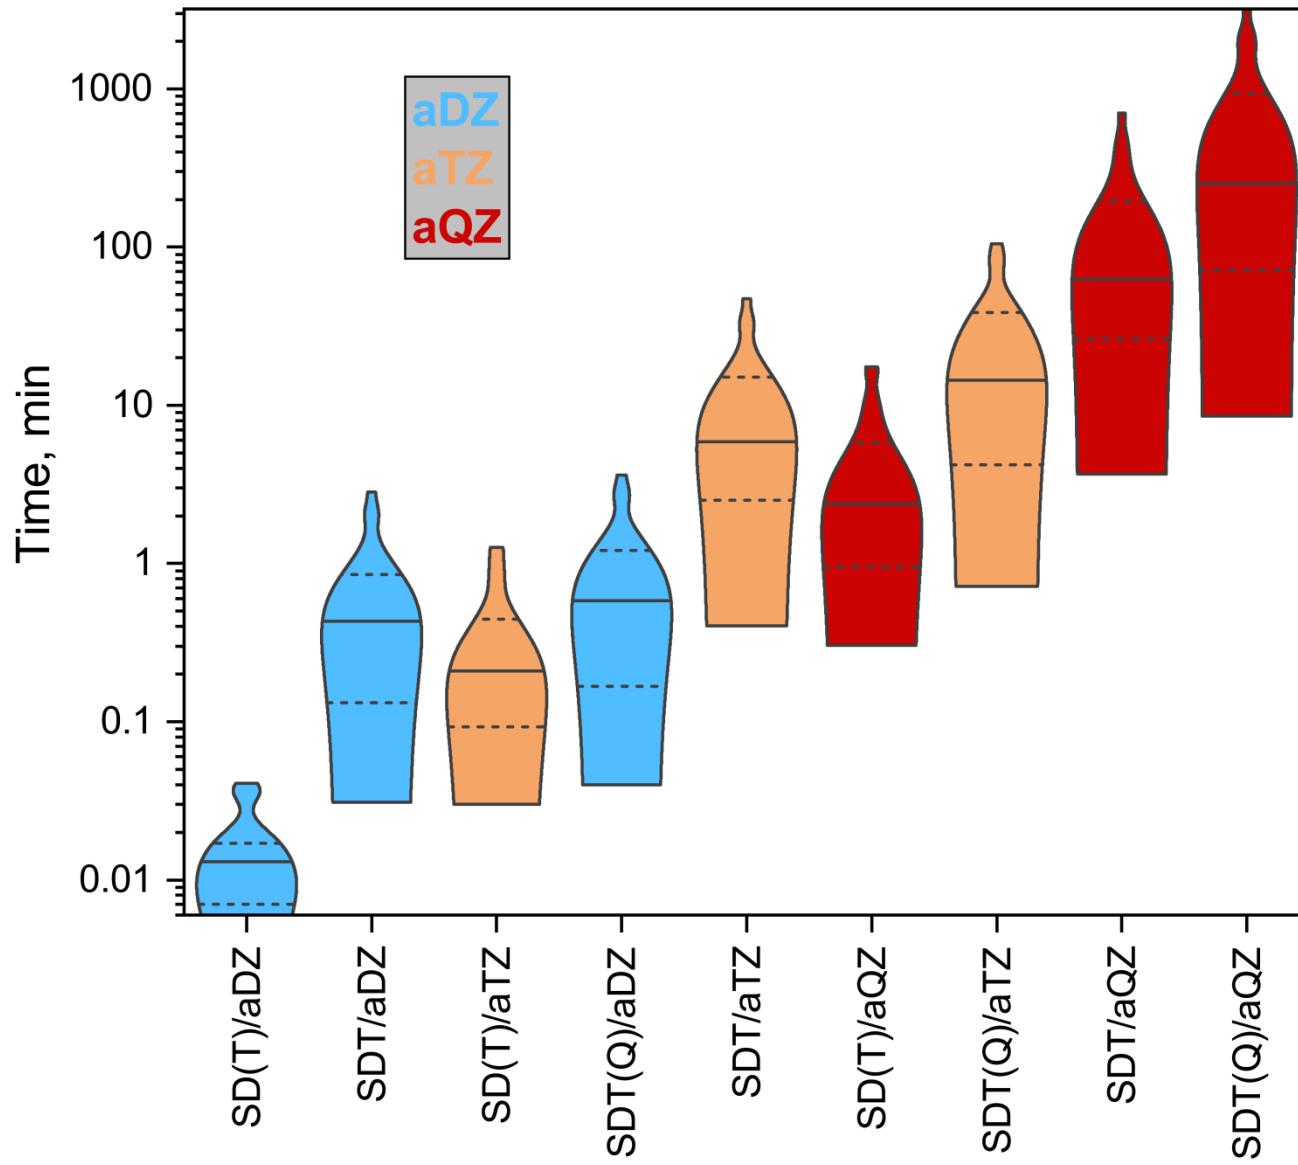

Figure S13. Computational times for different levels of theory. The times for the FC and CV calculations were combined and used for the visualization. The data for the SD(T) method were obtained using the optimized CCSD(T) program “ccsd” for systems for which SDT(Q) computations were performed. The median (solid), 25th, and 75th percentiles (dash) are shown.

Batch #6

Table S12. Absolute deviations of core-valence corrections to the atomization energy from reference values in kcal mol⁻¹. Reference values (REFERENCE) are computed as the mean of SDT(Q)/eN{T,Q}Z (N = 1 – 3) values. The geometries were optimized using SD(T)/nZ method with the basis set and frozen core approximation type corresponding to the given energy evaluation (FC-SD(T) for the FC component of core-valence correction and CV-SD(T) for the CV one). The range of SDT(Q)/eN{T,Q}Z (N = 1 – 3) values (RANGE, RMS = 0.0106 kcal mol⁻¹) and the absolute deviations for a given coupled-cluster method and basis set (including extrapolated results) are shown. Color encoding shows the highest (red) and the lowest (green) values. Maximum (MAX), mean (MAD), root mean square (RMS), and standard deviation (SD) are provided at the bottom of the Table.

System	REFERENCE	RANGE	SD(T)/DZ	SDT/DZ	SDT(Q)/DZ	SD(T)/TZ	SDT/TZ	SDT(Q)/TZ	SD(T)/QZ	SDT/TQZ	SDT(Q)/QZ	SDT(Q)/e1{D,T}Z	SDT/e1{D,T}Z	SDT(Q)/e1{D,T}Z	SD(T)/e1{T,Q}Z	SDT(e1{T,Q}Z)	SDT(Q)/e1{T,Q}Z	SDT(e2{D,T}Z	SDT(e2{D,T}Z	SDT(e2{T,Q}Z	SDT(e2{T,Q}Z	SDT(Q)/e2{D,T}Z	SDT(e3{D,T}Z	SDT(e3{T,Q}Z	SDT(e3{T,Q}Z	SDT(Q)/e3{T,Q}Z

Table S13. Differences between absolute deviations obtained at given levels of theory in kcal mol⁻¹. The geometries were optimized as indicated in the header of Table S12. Reference values are computed as the mean of SDT(Q)/eN{T,Q}Z (N = 1 – 3) values. Positive values are highlighted in red. Maximum (MAX), mean (MAD), root mean square (RMS), and standard deviation (SD) are provided at the bottom of the Table.

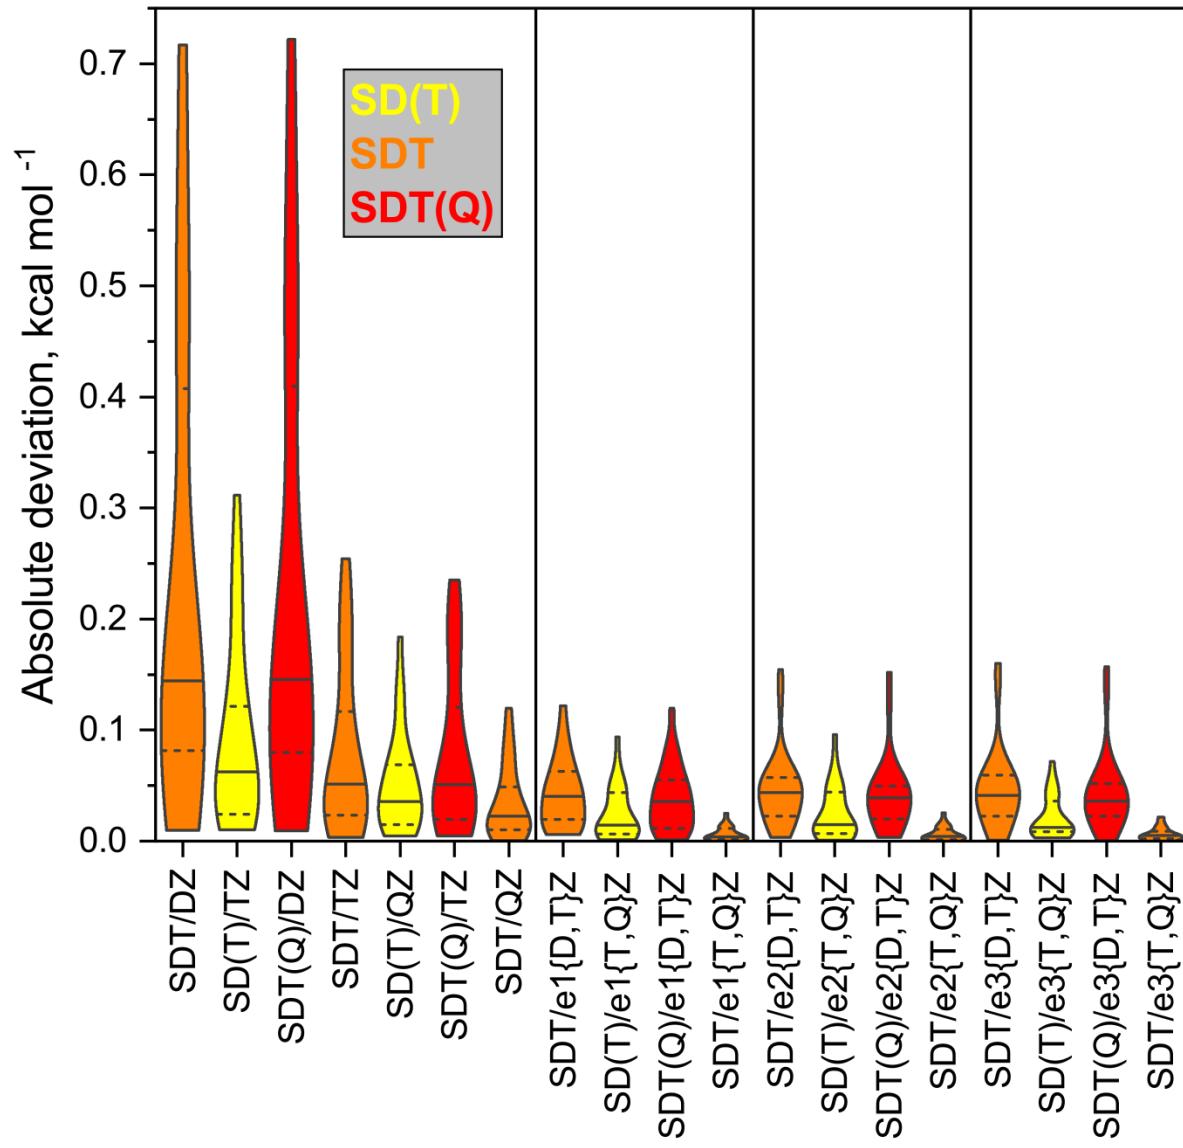

Figure S14. Violin plots of the absolute deviations obtained at a given level of theory. The geometries were optimized as indicated in the header of Table S12. Reference values are computed as the mean of $\text{SDT(Q)}/\text{eN}\{\text{T},\text{Q}\}\text{Z}$ ($N = 1 - 3$) values. The median (solid), 25th, and 75th percentiles (dash) are shown. The highest point of a plot represents the maximum deviation.

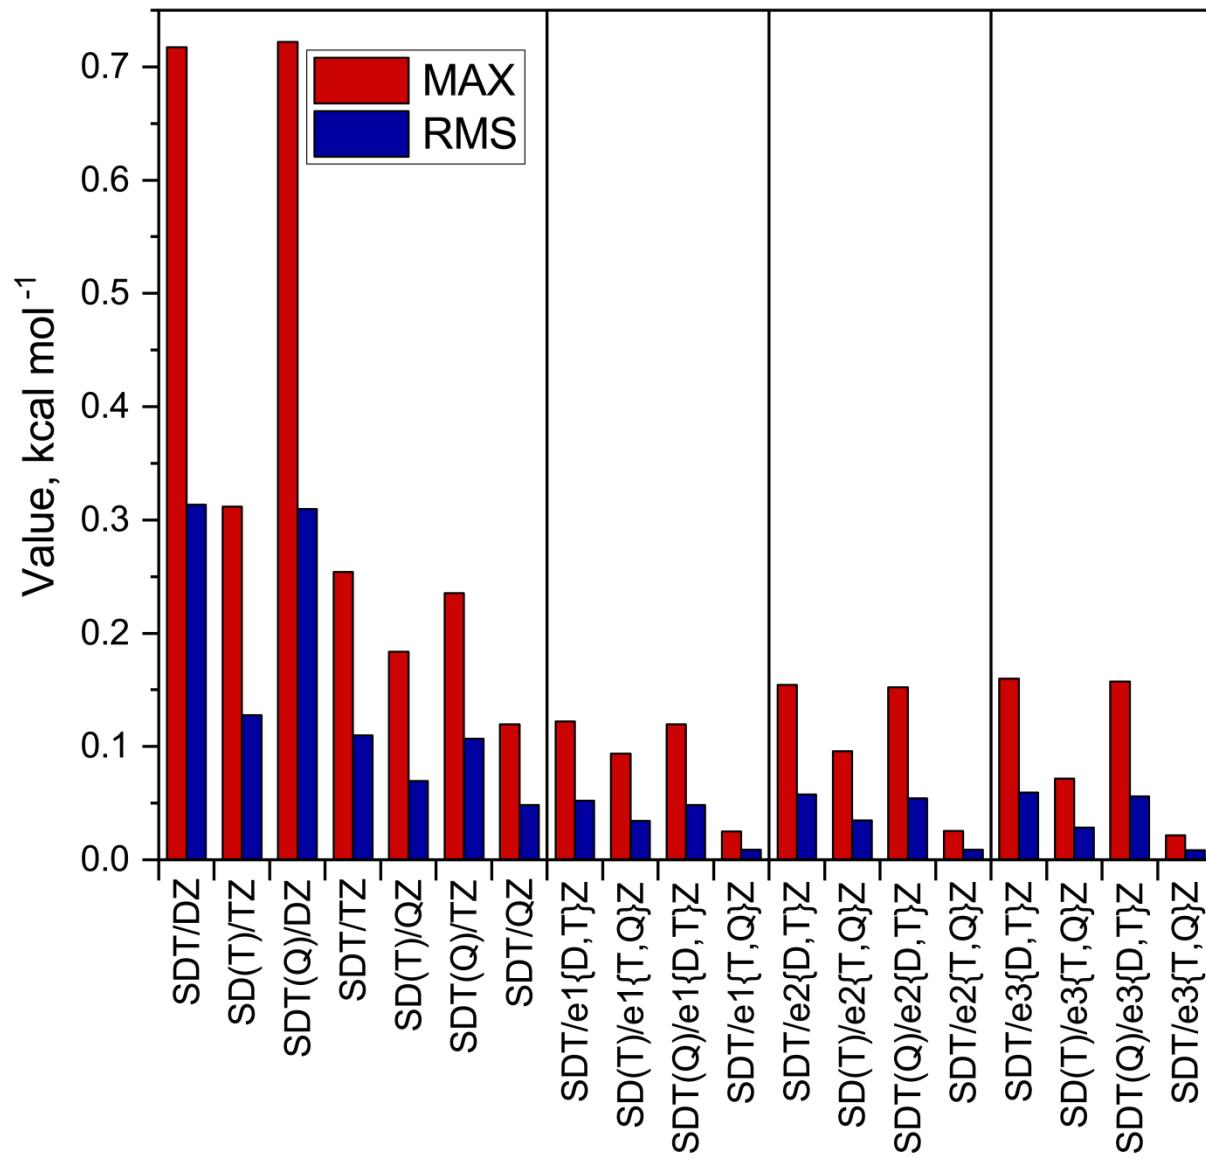

Figure S15. Maximum (MAX) and root mean square (RMS) values for the absolute deviations obtained at a given level of theory. The geometries were optimized as indicated in the header of Table S12. Reference values are computed as the mean of $\text{SDT}(Q)/eN\{T,Q\}Z$ ($N = 1 - 3$) values.

Cartesian Coordinates of Optimized Structures

The data below are given in multiple XYZ-file format: the first line is the number of atoms (N), the second line is a comment presenting the system and level of theory for geometry optimization, and the following N lines contain atomic cartesian coordinates. Multiple structures are placed directly end-to-end.

Raw Energies

Table S16. Raw data for SD(T)/nZ (n = D, T, Q, 5) computations. System name (System), core electrons treatment (CV), basis set cardinal number (Cardinal), multiplicity (M), total number of electrons (N_{el}), number of valence electrons (N_{val_el}), number of basis functions (Basis size), time for SD(T) computation, (Time SD(T)), time for SD computation (Time SD), and energy components in Hartree (HF, CCSD, CCSD(T)) are provided.

Table S17. Raw data for SDT(Q)/nZ ($n = D, T, Q$) computations. System name (System), core electrons treatment (CV), basis set cardinal number (Cardinal), multiplicity (M), total number of electrons (N_{el}), number of valence electrons (N_{val_el}), number of basis functions (Basis size), time for SDT(Q) computation, (Time SDT(Q)), time for SDT computation (Time SDT), and energy components in Hartree (CCSDT, CCSDT(Q)) are provided.

Table S18. Raw data for SDTQ(P)/nZ (n = D, T) computations. System name (System), core electrons treatment (CV), basis set cardinal number (Cardinal), multiplicity (M), total number of electrons (N_{el}), number of valence electrons (N_{val_el}), number of basis functions (Basis size), time for SDTQ(P) computation, (Time SDTQ(P)), time for SDTQ computation (Time SDTQ), and energy components in Hartree (CCSDTQ, CCSDTQ(P)) are provided.

Table S21. Raw data for SDT(Q)/nZ ($n = D, T, Q$) computations. The geometries were optimized using SD(T)/nZ method with the basis set and frozen core approximation type corresponding to the given energy evaluation (FC-SD(T) for the FC single-point computation and CV-SD(T) for the CV one). System name (System), core electrons treatment (CV), basis set cardinal number (Cardinal), multiplicity (M), total number of electrons (N_{el}), number of valence electrons (N_{val_el}), number of basis functions (Basis size), time for SDT(Q) computation, (Time SDT(Q)), time for SDT computation (Time SDT), and energy components in Hartree (HF, CCSD, CCSD(T), CCSDT, CCSDT(Q)) are provided.
