## S1. EXPERIMENTAL SECTION

**Materials.**  $[\text{Ir}(\text{df}(\text{CF}_3)\text{ppy})_2(\text{bpy})]\text{PF}_6$  (**1**) was purchased from Sigma-Aldrich (MQ100) and ChemScene (> 95.0 %). Both HPLC and spectroscopic grade dimethylformamide (DMF) were purchased from TCI and TEDIA. 4-Bromobenzotrifluoride (99%), 4'-bromoacetophenone (98%), 4-bromoanisole (> 99.9%), 4-bromotoluene (98%), 4-bromobiphenyl (98%), 2-chlorobenzotrifluoride (99%), 4-chlorobenzonitrile (99%),  $\alpha,\alpha,\alpha$ -trifluorotoluene (> 99%), 4-fluorotoluene (97%), acetophenone (> 98%), anisole (99%), toluene (ACS reagent, > 99.5%), biphenyl (> 99%), benzonitrile (99%), *N*-(*tert*-butoxycarbonyl)-proline (*N*-Boc proline) (> 99.0%), cesium carbonate ( $\text{Cs}_2\text{CO}_3$ ) (99.9% trace metals basis) and 1,1,3,3-tetramethylguanidine (TMG) (99%) were purchased from Sigma-Aldrich. Ammonium acetate (97%) was purchased from Alfa Aesar. Ethanol (99.8%, analytical reagent grade) was purchased from Fisher Scientific. 1,8-Diazabicyclo[5.4.0]undec-7-ene (98+, DBU) was purchased from Alfa Aesar.

**In situ formation of modified iridium complexes.** *N*-Boc proline (0.03 M),  $\text{Cs}_2\text{CO}_3$  (0.03 M) and **1** (0.2 mM) were added into a 25 mL Schlenk tube containing DMF (10 mL). The reaction mixture was sealed with a PTFE stopcock and degassed by bubbling Ar for 30 min. The mixture was then irradiated with a 456-nm LED lamp (40 W, Kessil) placed ~3.5 cm away from the center of the tube for an irradiation time  $t_{\text{irra}}$  between 0.5 to 12 h. The reaction temperature was maintained at 30 °C using a standing fan. After light exposure, the mass spectrum of the solution was recorded using a mass spectrometer (Themo Finnigan LCQ Fleet).

Ir complex **2** was purified with a C18 semi-preparative column fitted to a reversed-phase high performance liquid chromatography (HPLC)-photodiode array system (Waters). Briefly, a 30-min blue light irradiated mixture ( $t_{\text{irra}} = 30$  min) was concentrated and injected into the HPLC.

The mobile phases used were acetonitrile and 10 mM ammonium acetate in Milli-Q water. A gradient system, shown in the table below, was used to separate the modified iridium complexes:

Time (min)	10 mM Ammonium acetate (%)	Acetonitrile (%)
0	15	85
70	20	80
120	15	85

To purify **Ir-mod**, the mixture after blue light irradiation for a prolonged time ( $t_{\text{irra}} = 2, 4, 6, 8, 12$  and  $14$  h) was added to an equivalent volume of 0.01 mM of ammonium hexafluorophosphate. The mixture is left to stand for 15 min before it is transferred into a 1.5 mL centrifuge tube and centrifuged at 13000 rpm for 10 min. The supernatant is removed and the solid is dissolved in ethyl acetate. Purification of the complexes was achieved by flash column chromatography using hexane/ethyl acetate (2:1) as eluents on a silica gel column. The fractions were concentrated *via* rotary evaporation and subjected to the anion exchange procedure.

**Irradiation of 1.** MS experiment: **1** (0.2 mM) was added into a 25 mL Schlenk tube containing DMF (10 mL). The mixture was sealed with a PTFE stopcock and degassed by bubbling Ar for 30 min. The mixture was then irradiated with a 456-nm LED lamp (40 W, Kessil) placed  $\sim 3.5$  cm away from the center of the tube for an irradiation time  $t_{\text{irra}}$  of 6 h. The reaction temperature was maintained at 30 °C using a standing fan. After light exposure, the mass spectrum of the solution was recorded using a mass spectrometer (Themo Finnigan LCQ Fleet).

Emission experiment: A 1.0 Schlenk arm quartz fluorescence cuvette was used, and **1** (30  $\mu\text{M}$ ) was prepared in DMF. The solution was degassed by bubbling Ar into the solution for 30 min. The solution was irradiated with a 456-nm LED lamp (40 W, Kessil) placed 3.5 cm away from the center of the cuvette and irradiated from 0 - 90 min. Emission spectra in DMF were measured on a fluorescence spectrometer (Varian Cary Eclipse). The emission spectrum was recorded using an excitation wavelength  $\lambda_{\text{ex}} = 340 \text{ nm}$ .

**Anion-exchange.** Ammonium hexafluorophosphate (15 mg, 1 mM) was first added into Milli-Q water (10 mL), and the solution added into a DMF solution of the iridium complex (0.01 mM). The mixture was then left to sit for 15 min before centrifugation at 13000 rpm for 10 min. The supernatant was removed and the solid sediment washed with Milli-Q water ( $3 \times 1 \text{ mL}$ ), centrifuged and dried in a desiccator.

**Preparation of *N*-Boc-Pro-OCs.** *N*-Boc proline (0.03 M) and  $\text{Cs}_2\text{CO}_3$  (0.03 M) were added into an 8 mL vial containing ethanol (3 mL) and a stir bar. The solution was stirred overnight until it turned clear. The solution was then concentrated using a rotary evaporator and dried in a desiccator.

**X-ray crystallography.** X-ray-quality crystals of **2** were grown by the slow vapor diffusion method. Basically, the HPLC eluate collected between  $t_r = 132$  and 147 min (Fig. S2†) was dissolved in dichloromethane. The solution was passed through a PTFE filter and added into an oven-dried 4 mL vial. The vial was covered with an aluminium foil, and punctured in the middle using a 22 G needle. The vial was placed inside a 25 mL vial and 2 mL of pentane was added into

the outer vial. The 25 mL vial was sealed with Parafilm and allowed to stand in the dark. Orange plate-like crystals were formed in the inner vial within 96 h. A similar procedure was also adopted for obtaining crystals of **1**.

***Ir complex 2/Ir complex 1:*** A crystal of approximate dimensions (0.020 mm × 0.200 mm × 0.220 mm)/( 0.005 mm × 0.010 mm × 0.100 mm) was used for the X-ray crystallographic analysis. The X-ray intensity data ( $\lambda = 0.71073 \text{ \AA}$ ) was measured according to the data collection details in Table S4†/S13†.

A total of 383/420 frames were collected with a total exposure time of 0.64 h/0.93 h. The Bruker SAINT software package, using a narrow-frame algorithm, was used to integrate the frames. A total of 90199/141121 reflections to a maximum  $\theta$  angle of 25.00°/27.00° (0.84 Å/0.78 Å resolution) were yielded when the data was integrated using an orthorhombic unit cell. 10180/10989 reflections were independent (average redundancy 8.860/12.842, completeness = 99.9 %/99.9 %,  $R_{\text{int}} = 7.61 \% / 14.30 \%$ ,  $R_{\text{sig}} = 4.05 \% / 5.72 \%$ ) and 7328/7185 (71.98 %/65.38 %) reflections were greater than  $2\sigma(F^2)$ . Upon refinement of the XYZ-centroids of 9799/9927 reflections above 20  $\sigma(I)$  with  $4.77^\circ / 4.547^\circ < 2\theta < 60.26^\circ / 54.57^\circ$ , we obtained the final cell constants of  $a = 25.7591(5) \text{ \AA} / 17.9150(8) \text{ \AA}$ ,  $b = 19.7247(4) \text{ \AA} / 22.4618(9) \text{ \AA}$ ,  $c = 22.7912(4) \text{ \AA} / 25.0531(8) \text{ \AA}$ , and volume =  $11580.0(4) \text{ \AA}^3 / 10081.4(7) \text{ \AA}^3$ . The Multi-Scan method (SADABS) was used to correct the data for absorption effects. The minimum to maximum apparent transmission ratio was 0.733/0.727, and the calculated minimum and maximum transmission coefficients (based on crystal size) were 0.6220/0.7630 and 0.9540/0.9860.

The Bruker SHELXTL Software Package was used to solve the structure and for structure refinement using the space group P b c n/P c c n, with  $Z = 8$  for the formula unit,  $C_{53}H_{52}F_{10}IrN_5O_4/C_{47.25}H_{43.50}Cl_{2.50}F_{10}IrN_4O_4$ . The final anisotropic full-matrix least-squares refinement on  $F^2$  with

728/795 variables converged at R1 = 7.38 %/4.77 % for the observed data and wR2 = 18.83 %/14.93 % for all data; the goodness-of-fit was 1.197/1.066. The largest peak in the final difference electron density synthesis was 2.556 e<sup>-</sup> Å<sup>-3</sup>/1.828 e<sup>-</sup> Å<sup>-3</sup>, largest hole was -4.613 e<sup>-</sup> Å<sup>-3</sup>/0.894 e<sup>-</sup> Å<sup>-3</sup> with an RMS deviation of 0.156 e<sup>-</sup> Å<sup>-3</sup>/0.159 e<sup>-</sup> Å<sup>-3</sup>, calculated density was 1.383 g cm<sup>-3</sup>/1.584 g cm<sup>-3</sup> and F(000), 4832 e<sup>-</sup>/4772 e<sup>-</sup>. Characterization data are provided in the Supplementary Tables S4† – S19†.

**Steady-state spectroscopy.** UV-Vis absorption and emission spectra in DMF were measured on a UV-Vis spectrophotometer (Varian Cary 100 Bio) and fluorescence spectrometer (Varian Cary Eclipse), respectively. A 1.0 Schlenk arm quartz fluorescence cuvette was used, and **1** (30 μM), **2** and **Ir-mod** were prepared in DMF (spectroscopy grade). The absorbance of **2** and **Ir-mod** in DMF were matched at 340 nm to that of **1**. All samples were degassed prior to measurement by bubbling Ar for 20 min. For the Stern-Volmer analysis, various concentrations of *N*-Boc-Pro-OCs (*i.e.*, from 0.167 to 4.5 mM) were added into the solutions of **1** and **2**. The emission spectra were measured using an excitation wavelength  $\lambda_{\text{ex}} = 340$  nm. Stern-Volmer analysis was also conducted for **Ir-mod** ( $t_{\text{irra}} = 8$  h) with *N*-Boc-Pro-OCs concentration varying from 0.5 to 20 mM. At high concentrations of *N*-Boc-Pro-O-Cs, the emission of **Ir-mod** was corrected for the fraction of light absorbed by *N*-Boc-Pro-OCs using the following equation:

$$F_{\text{Ir-mod}} = \frac{A_{\text{Ir-mod}}}{A_{\text{Ir-mod}} + A_{\text{N-Boc-Pro-O-Cs}}} (1 - 10^{-(A_{\text{Ir-mod}} + A_{\text{N-Boc-Pro-O-Cs}})})$$

where  $A_{\text{Ir-mod}}$  and  $A_{\text{N-Boc-Pro-O-Cs}}$  are the absorbance of **Ir-mod** and *N*-Boc-Pro-OCs at 340 nm.

The emission quantum yields were determined as follows: **1** (30 μM) and **2** (50 μM) in degassed DMF and **1** in degassed acetonitrile (ACN) (absorbance at 400 nm matched to either that

of **1** or **2** in DMF) were prepared and the emission spectra recorded using an excitation wavelength  $\lambda_{\text{ex}} = 400 \text{ nm}$ . The emission quantum yields of **1** and **2** in DMF (*i.e.*,  $\phi_{f,1}$ ) were determined using the following equation  $\frac{\phi_{f,1}}{\phi_{f,2}} = \frac{(1-10^{-A_2})n_1^2\alpha_1}{(1-10^{-A_1})n_2^2\alpha_2}$ , where  $\phi_{f,2} (= 0.68)^{S1}$  is the emission quantum yield of **1** in ACN,  $A_1$  and  $A_2$  are the absorbances at 400 nm for the samples in DMF and ACN, respectively,  $n_1$  and  $n_2$  are the refractive indices of DMF and ACN, respectively, and  $\alpha_1$  and  $\alpha_2$  are the areas under the emission spectra in DMF and ACN, respectively.

**Time-resolved spectroscopy. Emission lifetime decay.** The emission lifetime decays of the excited state of the iridium complexes were measured using a laser flash photolysis spectrometer (LKS.60, Applied Photophysics) equipped with a Q-Switched Nd:YAG laser (Brilliant B, Quantel) and a R928 photomultiplier. All samples were excited using a 355-nm light, and emission of **1/2** and **Ir-mod** monitored at 495 nm and 530 nm, respectively. In the first experiment, the lifetime decays of **1** (200  $\mu\text{M}$ ), **2** (200  $\mu\text{M}$ ) and **Ir-mod** ( $t_{\text{irra}} = 8 \text{ h}$ , absorbance at 355 nm matched to that of 200  $\mu\text{M}$  **1**) in degassed DMF were recorded. In the second experiment, Stern-Volmer analysis was conducted by separately adding different amounts of *N*-Boc-Pro-OCs (*i.e.*, 0.167 – 5 mM) into degassed DMF solutions of **1** (30  $\mu\text{M}$ ) and **2** (30  $\mu\text{M}$ ). In the third experiment, both the steady-state emission spectra and lifetime decays of degassed DMF solutions of **1** and isolated **Ir-mod** prepared after various light exposure times  $t_{\text{irra}}$  were measured in the absence and presence of 4.5 mM *N*-Boc-Pro-OCs. In this case, the absorbances of the **Ir-mod** solutions at 340 nm and 355 nm were matched to that of 30  $\mu\text{M}$  **1** for the steady-state and time-resolved studies, respectively. In the fourth experiment, a degassed DMF solution of **1** (200  $\mu\text{M}$ ) and excess *N*-Boc-Pro-OCs (30 mM) was first exposed to blue light (456 nm lamp) for 8 h, and the lifetime decay of the resulting

solution containing modified iridium complexes (**Ir-mod**) immediately measured. The concentrations of **1** and *N*-Boc-Pro-OCs were the same as in the hydrodehalogenation experiments.

*ns-Transient absorption spectroscopy.* ns-Transient absorption (TA) spectroscopy was conducted using a laser flash photolysis spectrometer (LKS.60, Applied Photophysics), equipped with a Q-Switched Nd:YAG laser (Brilliant B, Quantel), 150 W Xe lamp and R928 photomultiplier, to record ns-difference absorption ( $\Delta OD$ ) spectra. The samples were excited at 355 nm. The sample solutions were prepared by degassing DMF solutions of **1** (200  $\mu$ M), **2** (200  $\mu$ M) and **Ir-mod** ( $t_{\text{irra}} = 8$  h) (absorbance at 355 nm matched to that of 200  $\mu$ M **1**) by bubbling Ar for 20 min.

**Cyclic Voltammetry.** A 3-electrode glass electrochemical cell with a Teflon cap and glassy carbon working electrode, platinum wire counter electrode and an Ag/AgCl reference electrode (RedoxMe) was used. Cyclic voltammetry (CV) was performed with a potentiostat (Metrohm Autolab PGSTAT204). For the measurements, **1**, **2**, **Ir-mod** ( $t_{\text{irra}} = 8$  h), *N*-Boc proline and *N*-Boc pyrrolidine were dissolved in dry DMF or dry ACN with TBAPF<sub>6</sub> (0.1 M) as the electrolyte. The solutions were degassed by bubbling Ar for at least 30 min prior to measurements. Ferrocene (Fc) was used as a standard for conversion to *vs.* saturated calomel electrode (SCE) (*i.e.*,  $E_{Fc^+/Fc} = +0.4$  V).

**Hydrodehalogenation of aryl halides with **1** and **2**.** In a 10-mL Schlenk tube equipped with a magnetic stir bar, *N*-Boc proline (0.03 M), Cs<sub>2</sub>CO<sub>3</sub> (0.03 M), aryl halide (0.02 M) and **1** or **2** (0.2 mM) were added into DMF (3 mL). The reaction mixture was sealed with a PTFE stopcock and degassed by bubbling Ar for 30 min. The reaction mixture was then irradiated for 24 h with a 456-

nm LED lamp (40 W, Kessil) placed 3.5 cm away from the centre of the tube. A standing fan was used to keep the reaction temperature at 30°C throughout the entire reaction. For the work up, the reaction mixture was diluted with a NaHCO<sub>3</sub> solution and extracted thrice with ethyl acetate. The organic solution was washed thrice with water before being dried over MgSO<sub>4</sub>, filtered and concentrated *via* rotatory evaporation. GC was used to determine all product yields and <sup>19</sup>F NMR was used to determine the product yields for the hydrodehalogenation reaction of aryl fluorides. An aliquot (1 mL) of the reaction mixture was injected into a gas chromatography spectrometer equipped with a SH-Rtx-5 column. Another 0.5 mL aliquot of the solution was added to an internal standard (4-fluorotoluene, 10 µL) and transferred into an NMR tube.

**Hydrodehalogenation of aryl halides with Ir-mod ( $t_{\text{irra}} = 8 \text{ h}$ ).** In a 10-mL Schlenk tube equipped with a magnetic stir bar, *N*-Boc proline (0.03 M), Cs<sub>2</sub>CO<sub>3</sub> (0.03 M), aryl halide (0.02 M) and **Ir-mod** ( $t_{\text{irra}} = 8 \text{ h}$ ) (0.6 mM) were added into DMF (3 mL). The reaction mixture was sealed with a PTFE stopcock and degassed by bubbling Ar for 30 min. The reaction mixture was then irradiated for 24 h with a 456-nm LED lamp (40 W, Kessil) placed 3.5 cm away from the centre of the tube. A standing fan was used to keep the reaction temperature at 30°C throughout the entire reaction. For the work up, the reaction mixture was diluted with a NaHCO<sub>3</sub> solution and extracted thrice with ethyl acetate. The organic solution was washed thrice with water before being dried over MgSO<sub>4</sub>, filtered and concentrated *via* rotatory evaporation. GC was used to determine all product yields and <sup>19</sup>F NMR was used to determine the product yields for the hydrodehalogenation reaction of aryl fluorides. An aliquot (1 mL) of the reaction mixture was injected into a gas chromatography spectrometer equipped with a SH-Rtx-5 column. Another 0.5 mL aliquot of the

solution was added to an internal standard (4-fluorotoluene, 10  $\mu$ L) and transferred into an NMR tube.

**Photochemical reaction quantum yield determination.**<sup>S2</sup> In a 1.0-cm Schlenk arm quartz fluorescence cuvette, *N*-Boc proline (0.03 M), Cs<sub>2</sub>CO<sub>3</sub> (0.03 M), 4-bromobenzotrifluoride (0.02 M) and **1** (0.6 mM) were added into DMF (3 mL). The reaction mixture was degassed by bubbling Ar into the solution for 30 min. The UV-Vis absorption spectrum of the reaction mixture at 456 nm was recorded with the UV-Visible spectrophotometer (Varian Cary 100 Bio). The illumination intensity of the Kessil lamp at 456 nm was recorded with a power meter (FieldMate, Coherent, USA) equipped with a sensor (PM150-50XC). The solution was irradiated for 2 h with a 456-nm LED lamp (40 W, Kessil) placed 3.5 cm away from the center of the tube. A standing fan was used to keep the reaction temperature at 30°C throughout the entire reaction. An internal standard (4-fluorotoluene, 0.02 mL) and the reaction mixture (0.5 mL) were added into an NMR tube and <sup>19</sup>F NMR was used to determine the yield. The reaction quantum yield was obtained with the following

equation  $\phi = \frac{\frac{nN_A}{t}}{\frac{fES\lambda}{hc}}$  where  $N_A$  is the Avogadro number,  $t$  is the reaction time,  $f$  is the absorption factor ( $f = 1 - 10^{-A}$ ) of the reaction solution absorbance at 456 nm,  $E$  is the illumination intensity,  $S$  is the area of the irradiated solution,  $\lambda$  is the wavelength of the Kessil lamp,  $h$  is Planck's constant and  $c$  is the velocity of light.

**Light-On/Off experiment.** In a 10-mL Schlenk tube equipped with a magnetic stir bar, *N*-Boc proline (0.03 M), Cs<sub>2</sub>CO<sub>3</sub> (0.03 M), 4-bromobenzotrifluoride (0.02 M) and **1** (0.6 mM) were added into DMF (3 mL). The reaction mixture was degassed by bubbling Ar into the solution for 30 min. The reaction was stirred and irradiated with a 456-nm LED lamp (40 W, Kessil) placed 3.5 cm

away from the center of the tube. Light-on (90 min) and light-off (90 min) cycles were conducted. To determine the product yield after each light-on or light-off event, a 0.2 mL aliquot of the solution was extracted under Ar and quenched upon addition of CDCl<sub>3</sub> (0.3 mL) and an internal standard (4-fluorotoluene, 0.02 mL). The mixture was then transferred into an NMR tube and <sup>19</sup>F NMR was used to determine the product yield.

**GC-FID analysis.** Gas chromatography (GC) with flame ionization detection (FID) was performed using capillary columns (length: 30 m; inner diam.: 0.25 mm; film: 0.25 µm) using He gas as carrier. GC-FID spectra were measured using a GC spectrometer (Shimadzu, GC-2010). The column temperature was programmed at 60 °C for the first 10 minutes and then 0.50 °C min<sup>-1</sup> from 60 °C to 65 °C, and then 7 °C min<sup>-1</sup> from 65 °C to 168 °C, and then 15 °C min<sup>-1</sup> from 168 °C to 260 °C. Peak integration and retention time of the GC chromatograms were obtained using the LabSolutions software from Shimadzu. Product yields were determined by comparing the peak area of the chromatogram against the calibration curve. Calibration curves and GC chromatograms are given in Fig. S25† - S58†.

**NMR spectroscopy.** <sup>1</sup>H and <sup>19</sup>F NMR spectra were recorded on a NMR spectrometer (400 MHz, JEOL) in either d-benzene or CDCl<sub>3</sub> with an internal solvent signal as reference (d-benzene: δH 7.26; CDCl<sub>3</sub>: δH 7.26). <sup>19</sup>F NMR was also conducted in DMF solvent with 4-fluorotoluene as the reference (δF -120.0 ppm). NMR data are reported as: chemical shift (ppm), multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet), coupling constants (Hz), number of protons and assignment of proton, if indicated. NMR spectra are given in Fig S5†, S6† and S59† - S87†.

**1:**  $^1\text{H}$  NMR (400 MHz, acetone-d<sub>6</sub>) (refer to Fig. 1):  $\delta$  8.93 (d, 2 H,  $J = 2$  Hz, dF(CF<sub>3</sub>)ppy, pyridyl-H<sup>5</sup>), 8.61 (dd, 2 H,  $J = 9$  Hz, 2 Hz, dtbbpy-H<sup>6</sup>), 8.40 (dd, 2 H,  $J = 9$  Hz, 2 Hz, dtbbpy-H<sup>8</sup>), 8.18 (d, 2 H,  $J = 6$  Hz, dF(CF<sub>3</sub>)ppy, pyridyl-H<sup>4</sup>), 7.69 (m, 4 H, dtbbpy-H<sup>7</sup> and dF(CF<sub>3</sub>)ppy, pyridyl-H<sup>3</sup>), 6.86 (td, 2 H,  $J = 9$  Hz, 2 Hz, dF(CF<sub>3</sub>)ppy, phenyl-H<sup>2</sup>), 5.97 (dd, 2 H,  $J = 9$  Hz, 2 Hz, dF(CF<sub>3</sub>)ppy, phenyl-H<sup>1</sup>), 1.47 (s, 18 H);  $^{13}\text{C}$  (400 MHz, acetone d<sub>6</sub>):  $\delta$  168.0, 165.5, 156.1, 155.8, 151.2, 145.8, 137.3, 126.9, 126.2, 125.2, 124.1, 122.7, 120.9, 114.6, 114.4, 99.3, 35.8, 29.5.<sup>S1</sup>

**2:**  $^1\text{H}$  NMR (400 MHz, acetone-d<sub>6</sub>):  $\delta$  8.84 (s, 1 H), 8.72 (s, 1 H), 8.64 (t, 2 H,  $J = 9$  Hz), 8.42 (t, 2 H,  $J = 9$  Hz), 8.17 (d, 1 H,  $J = 6$  Hz), 7.85 (s, 1 H), 7.81 (s, 2 H), 7.57 (s, 1 H), 7.00 (t, 1 H,  $J = 11$  Hz), 6.86 (t, 1 H,  $J = 11$  Hz), 6.05 (d, 1 H,  $J = 9$  Hz), 5.92 (d, 1 H,  $J = 9$  Hz), 5.54 (d, 1 H,  $J = 9$  Hz), 3.33 (m, 2 H), 2.38 (t, 2 H,  $J = 8$  Hz), 1.82 (m, 2 H), 1.42 (s, 9 H), 1.33 (s, 9 H), 1.29 (s, 9 H).

**Acetophenone:**  $^1\text{H}$  NMR (400 MHz, CDCl<sub>3</sub>):  $\delta$  7.86 – 7.83 (m, 2 H), 7.46 – 7.42 (m, 1 H), 7.36 – 7.32 (m, 2 H), 2.47 (s, 3 H).

**Anisole:**  $^1\text{H}$  NMR (400 MHz, CDCl<sub>3</sub>):  $\delta$  7.40 – 7.35 (m, 2 H), 7.06 – 7.03 (m, 1 H), 7.01 – 6.98 (m, 2 H), 3.87 (s, 3 H).

**Benzotrifluoride:**  $^1\text{H}$  NMR (400 MHz, CDCl<sub>3</sub>):  $\delta$  7.66 – 7.64 (m, 2 H), 7.58 – 7.55 (m, 1 H), 7.51 – 7.47 (m, 2 H).

**Toluene:**  $^1\text{H}$  NMR (400 MHz, CDCl<sub>3</sub>):  $\delta$  7.22 – 7.11 (m, 5 H), 2.30 (s, 3 H).

**Biphenyl:**  $^1\text{H}$  NMR (400 MHz, CDCl<sub>3</sub>):  $\delta$  7.61 – 7.60 (m, 2 H), 7.47 – 7.43 (m, 2 H), 7.36 (dd,  $J = 7, 2$  Hz, 1 H).

**Benzonitrile:**  $^1\text{H}$  NMR (400 MHz, CDCl<sub>3</sub>):  $\delta$  7.62 – 7.57 (m, 3 H), 7.48 – 7.44 (m, 2 H).  $^{19}\text{F}$  NMR (400 MHz, 4-Fluorotoluene):  $\delta$  62.9

**4-Bromoacetophenone:**  $^1\text{H}$  NMR (400 MHz, CDCl<sub>3</sub>):  $\delta$  7.81 (dt,  $J = 11, 2$  Hz, 2 H), 7.60 (dt,  $J = 11, 2$  Hz, 2 H), 2.58 (s, 3 H).

**4-Bromoanisole:**  $^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ ):  $\delta$  7.38 (dt,  $J = 4, 9$  Hz, 2 H), 6.79 (dt,  $J = 4, 9$  Hz, 2 H), 3.78 (s, 3 H).

**4-Bromobenzotrifluoride:**  $^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ ):  $\delta$  7.63 (d,  $J = 8$  Hz, 2 H), 7.49 (d,  $J = 8$  Hz, 2 H).  $^{19}\text{F}$  NMR (400 MHz, DMF, 4-fluorotoluene as internal standard):  $\delta$  62.9

**4-Bromotoluene:**  $^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ ):  $\delta$  7.37 (d,  $J = 8$  Hz, 2 H), 7.05 (d,  $J = 8$  Hz, 2 H), 2.31 (s, 3 H).

**4-Bromobiphenyl:**  $^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ ):  $\delta$  7.59 – 7.56 (m, 4 H), 7.49 – 7.43 (m, 4 H), 7.40 – 7.36 (m, 1 H).

**2-Chlorobenzotrifluoride:**  $^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ ):  $\delta$  7.70 (d,  $J = 8$  Hz, 1 H), 7.52 – 7.46 (m, 2 H), 7.37 (t,  $J = 8$  Hz, 1 H).  $^{19}\text{F}$  NMR (400 MHz, DMF, 4-Fluorotoluene as internal standard):  $\delta$  62.7

**4-Chlorobenzonitrile:**  $^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ ):  $\delta$  7.60 (dt,  $J = 4, 8$  Hz, 2 H), 7.46 (dt,  $J = 4, 8$  Hz, 2 H).

**Ir-mod/Ni dual-catalyzed decarboxylative cross-coupling of *N*-Boc proline and 4-bromobenzotrifluoride.** In a 10-mL Schlenk tube equipped with a magnetic stir bar, *N*-Boc proline (0.03 M),  $\text{Cs}_2\text{CO}_3$  (0.03 M),  $\text{NiCl}_2 \bullet \text{glyme}$  (2 mM), 4,4'-di-tert-butyl-2,2'-bipyridyl (3 mM), 4-bromobenzotrifluoride (0.02 M) and **Ir-mod** ( $t_{\text{irra}} = 8$  h) (0.6 mM) were added into DMF (3 mL). The reaction mixture was sealed with a PTFE stopcock and deoxygenated by bubbling Ar for 30 min. The reaction mixture was then irradiated for 72 h with a 456-nm LED lamp (40 W, Kessil) placed 3.5 cm away from the centre of the tube. A standing fan was used to keep the reaction temperature at 30°C throughout the entire reaction. For the work up, the reaction mixture was diluted with a  $\text{NaHCO}_3$  solution and extracted thrice with ethyl acetate. The organic solution

was washed thrice with water before being dried over MgSO<sub>4</sub>, filtered and concentrated *via* rotatory evaporation.

<sup>1</sup>H NMR spectra were recorded on a JEOL ECA400 spectrometer in CDCl<sub>3</sub> (TMS peak, δ = 7.26 ppm was used as an internal peak standard) (Fig. S87†). 1,1,2,2-tetrachloroethane (0.19 mmol, 20 μL) was used as an internal standard, NMR yield: 88%. <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>) rotameric mixtutre: δ 7.56 (d, J = 8.0 Hz, 2H), 7.29 (d, J = 8.0 Hz, 2H), 4.98 and 4.81 (2 brs, 1H, rotamer), 3.64 (m, 2H), 2.32 (m, 1H), 1.90-1.87 (m, 1H), 1.83-1.81 (m, 2H), 1.39 (s, 3H), 1.18 (s, 6H).

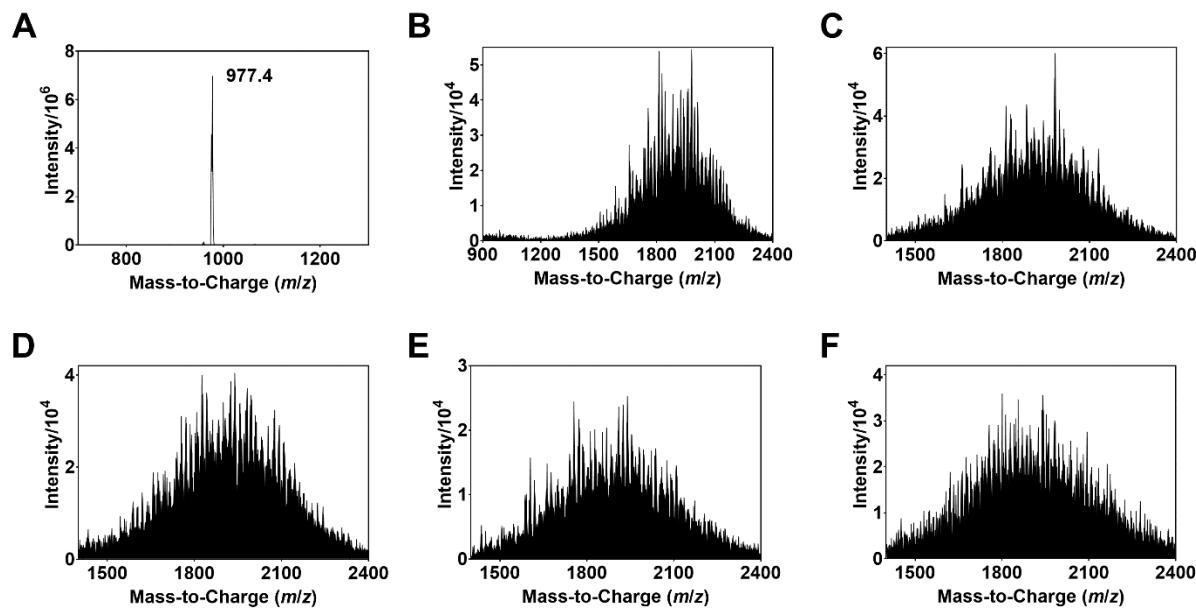

**Computational studies.** All geometries were optimized with Gaussian 09, Revision E.01.<sup>S3</sup> The density functional B3LYP was used in the geometry optimizations and time-dependent density functional calculations for singlet-singlet transition.<sup>S4,S5</sup> The basis set chosen in the calculations were: def2-svp for H, C, N, O, F, and def2-tzvp for Ir atom with def2-tzvp pseudo potential.<sup>S6,S7</sup> The solvent effect is modelled with PCM model in the DMF solution.<sup>S8</sup>

## S2. SUPPLEMENTARY FIGURES

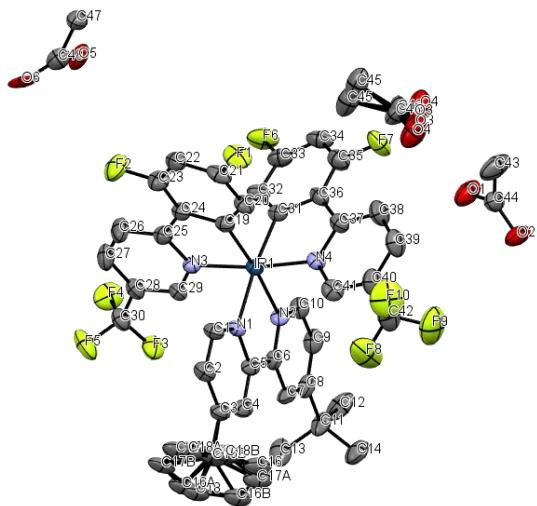

**Fig. S1** ESI-MS spectra of (A) non-irradiated **1**, and samples of **1** and *N*-Boc-Pro-OCs exposed to blue light for (B) 2 h (inset:  $m/z$  783.78 peak), (C) 4 h, (D) 6 h, (E) 12 h and (F) 14 h.

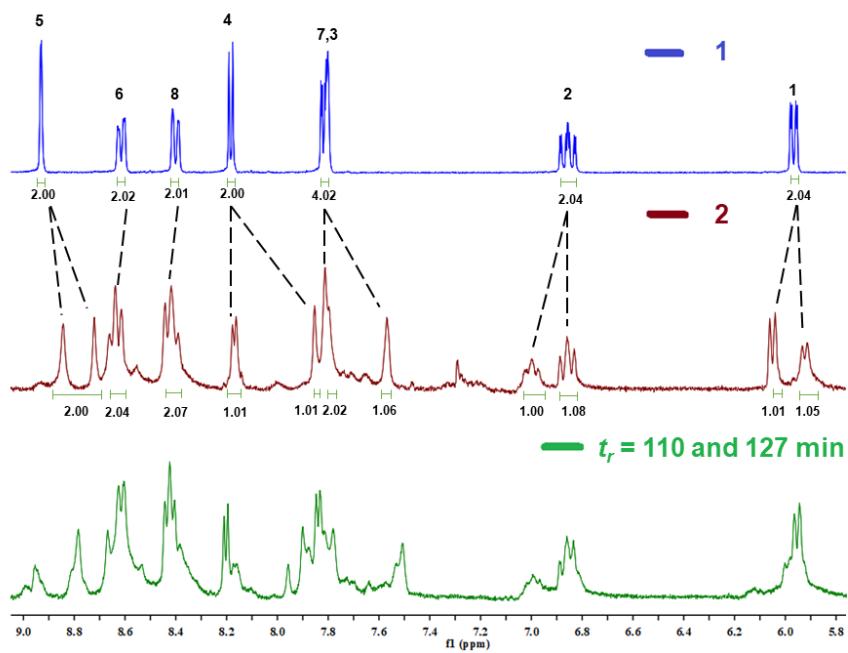

**Fig. S2** HPLC chromatogram. Solute eluted between retention times  $t_r = 110$  and 127 min,  $t_r = 132$  and 147 min (**Ir complex 2**), and  $t_r = 164$  and 229 min.

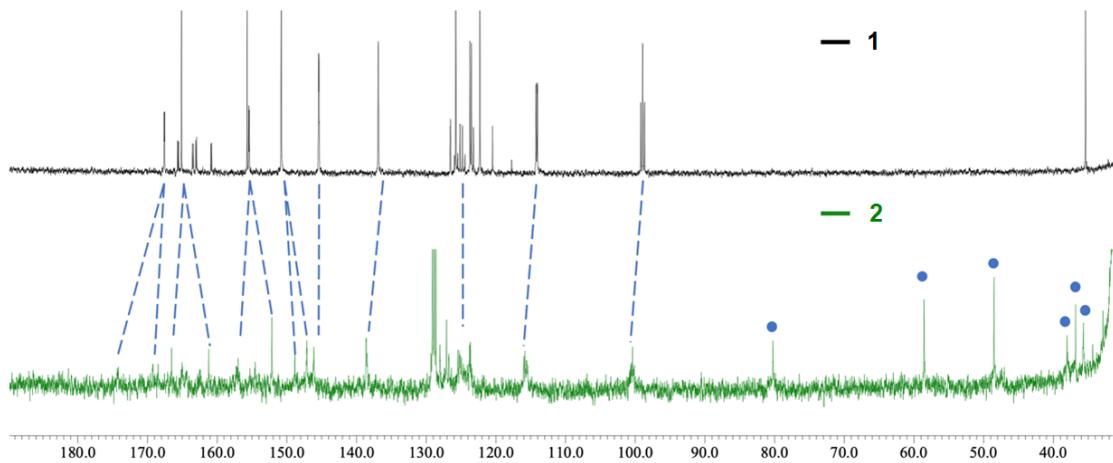

**Fig. S3** ESI-MS spectrum of isolated 2.

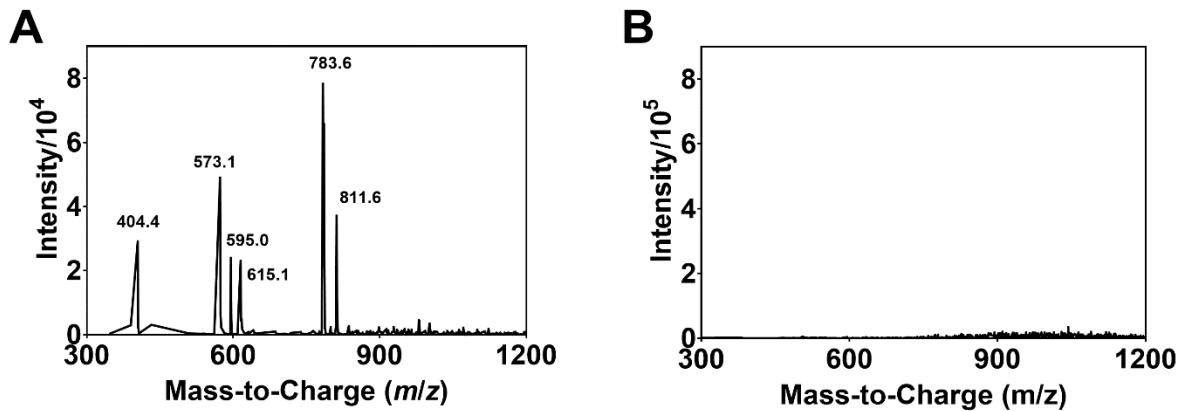

**Fig. S4** Structure and numbering scheme of **1**. Some disorder is observed in the *t*-Bu group of the bipyridine ligand. Acetate counter anions are shown, however, hydrogen atoms and dichloromethane (used during crystallization) were removed for clarity. See Supplementary Table S10 – S16 for additional data.

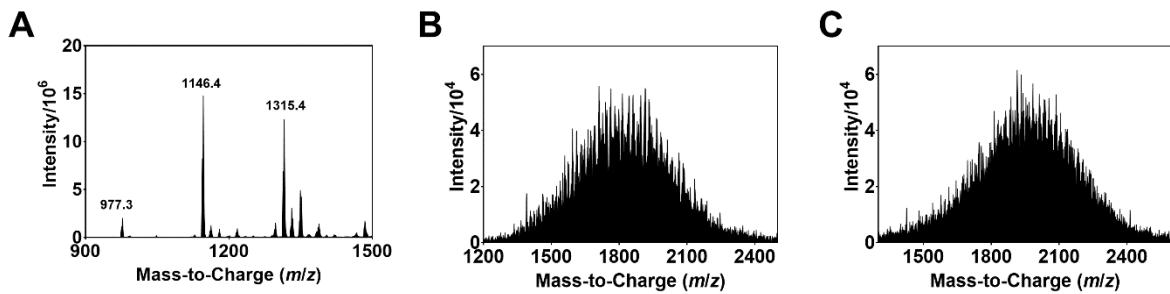

**Fig S5** <sup>1</sup>H NMR spectrum (400 MHz, acetone-d<sub>6</sub>) of **1**, **2** and the solute collected between *t<sub>r</sub>* = 110 and 127 min (Fig. S2†).

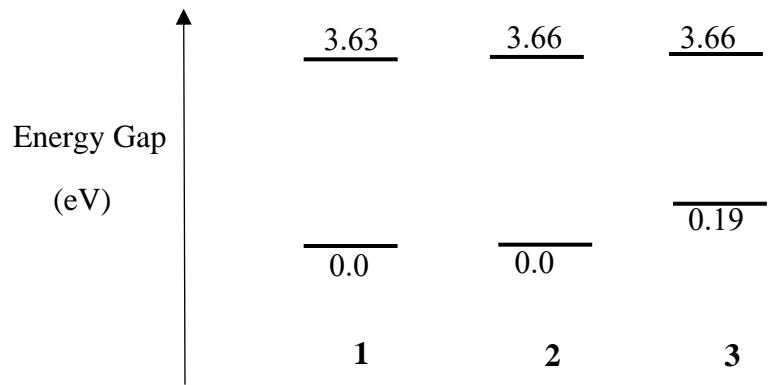

**Fig. S6** Partial <sup>13</sup>C NMR (400 MHz, acetone-d<sub>6</sub>) of **1** and **2**, showing splitting and shifting of aromatic carbons due to the asymmetrical structure. New peaks are seen in the upfield region of **2** due to the covalently bonded NBP molecule on the Ir complex.

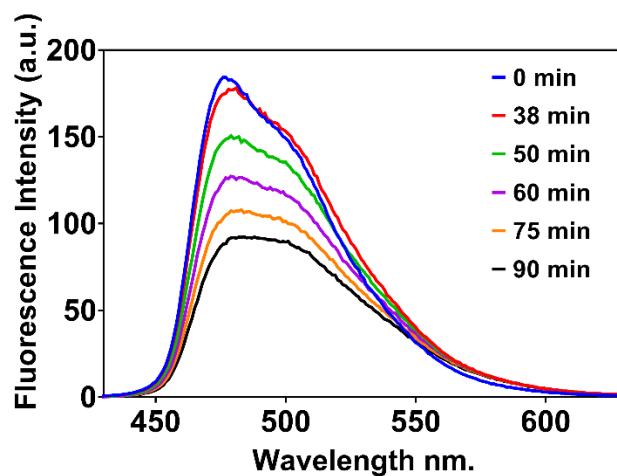

**Fig. S7** ESI-MS spectra after irradiating a degassed DMF solution of **1**, *N*-Boc proline and Cs<sub>2</sub>CO<sub>3</sub> with blue light (456 nm, 40 W) (A) before and (B) after purification with flash column chromatography. Only the  $300 < m/z < 1200$  region is shown.

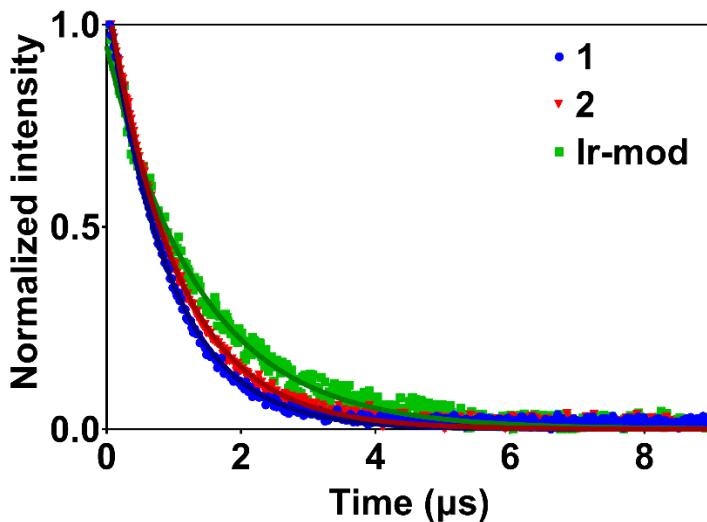

**Fig. S8** ESI-MS spectra of the modified complexes formed after irradiating a degassed DMF solution of **1**, *N*-Boc proline, Cs<sub>2</sub>CO<sub>3</sub> and 4-bromobenzotrifluoride with blue light (456 nm, 40 W) for (A) 0.5 h, (B) 2 h and (C) 8 h.

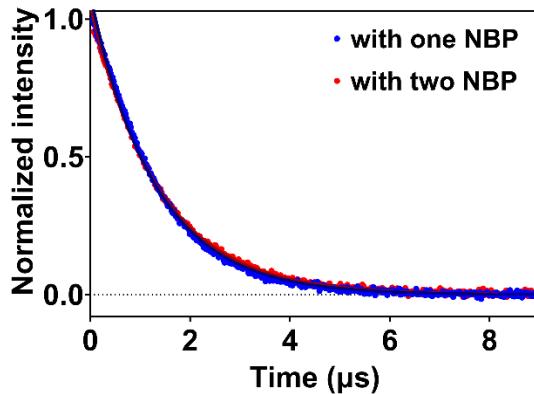

**Fig. S9** Energy diagram of the HOMO and LUMO of **1**, **2** and **3**.

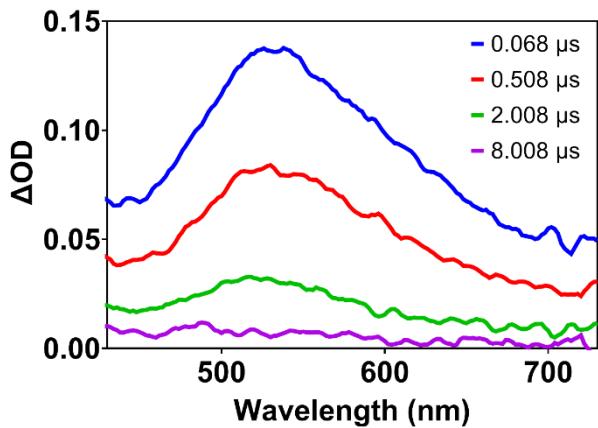

**Fig. S10** Emission spectra of a degassed DMF solution of **1** after different irradiation times with a 456-nm light.

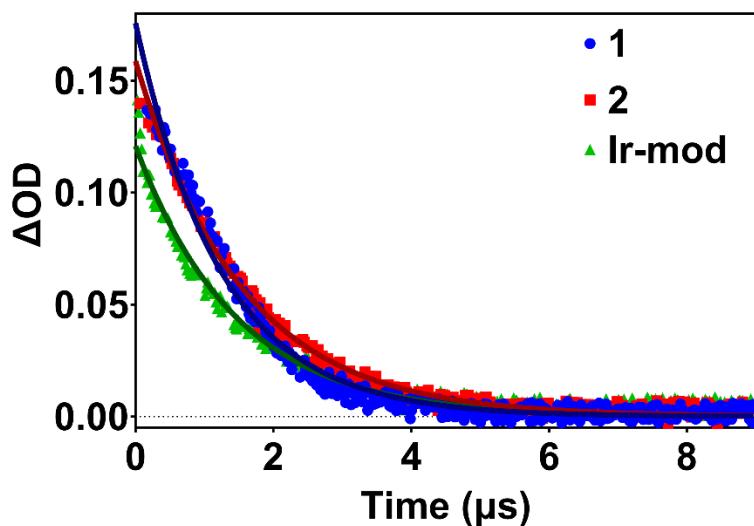

**Fig. S11** Normalized emission lifetime decay profiles of degassed DMF solutions of **1** (200  $\mu\text{M}$ ), **2** (200  $\mu\text{M}$ ), and **Ir-mod** ( $t_{\text{irra}} = 8 \text{ h}$ ) with absorbance matched to that of **1** at 355 nm. The excitation wavelength is  $\lambda_{\text{ex}} = 355 \text{ nm}$  for all samples. The emission is monitored at  $\lambda_{\text{em}} = 495 \text{ nm}$  for **1** and **2**, and  $\lambda_{\text{em}} = 530 \text{ nm}$  for **Ir-mod**. The decays are described using a mono-exponential decay function.

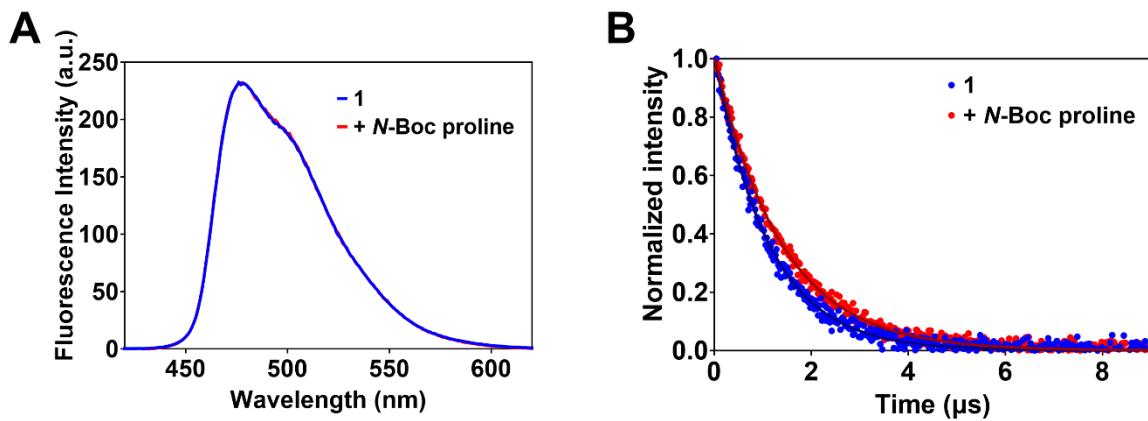

**Fig. S12** Normalized emission lifetime decay profiles of degassed DMF solutions of Ir(III) complex with one NBP unit substituted at a different position compared to **3** (*i.e.*,  $m/z$  1146 solute collected between  $t_{\text{R}} = 110$  and 127 min in Fig S2†) and Ir(III) complexes with two NBP substituents ( $m/z$  1315.4 solute). The excitation wavelength is  $\lambda_{\text{ex}} = 355 \text{ nm}$  and emission monitored at  $\lambda_{\text{em}} = 495 \text{ nm}$ . The decays are described by a mono-exponential decay function.

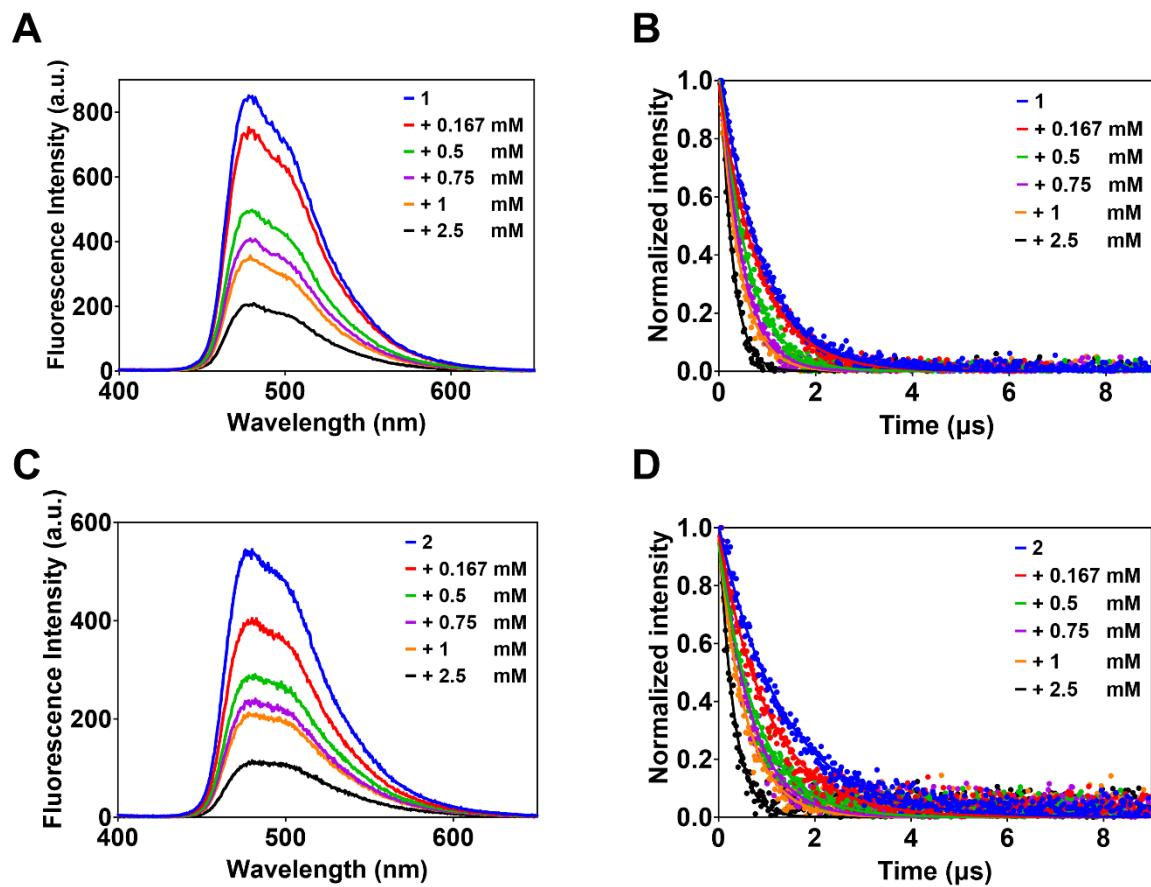

**Fig. S13** ns-Transient absorption spectra of a degassed DMF solution of **Ir-mod** ( $t_{\text{irra}} = 8 \text{ h}$ ) at various delay times. The absorbance of **Ir-mod** was matched to that of 200  $\mu\text{M}$  **1** at 355 nm, and the sample was excited at 355 nm.

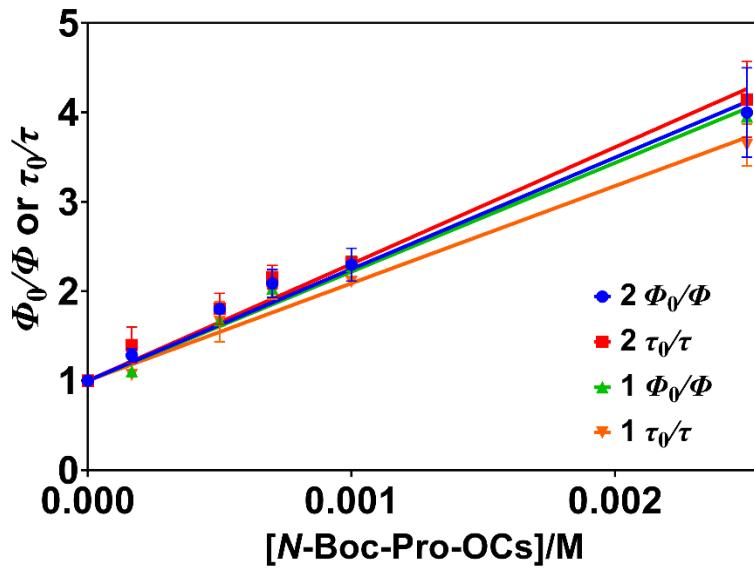

**Fig. S14** The kinetic traces of **1** (200  $\mu\text{M}$ ), **2** (200  $\mu\text{M}$ ) probed at 494 nm, and **Ir-mod** ( $t_{\text{irra}} = 8 \text{ h}$ ) probed at 530 nm. The traces are described using a mono-exponential decay function

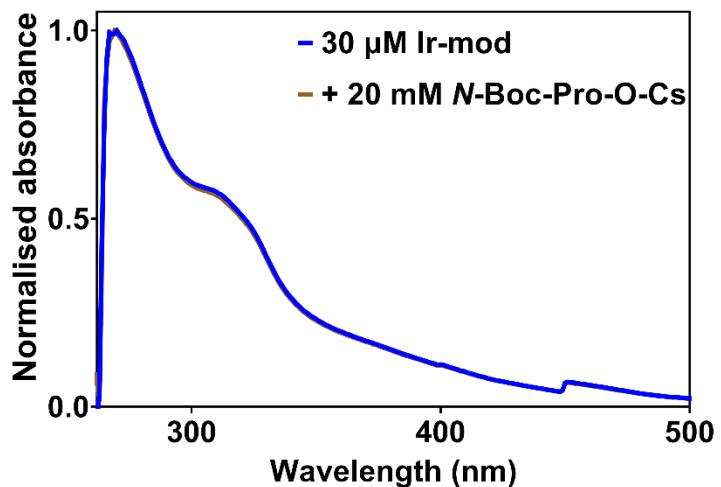

**Fig. S15** (A) Emission spectra of degassed DMF solutions of **1** in the absence and presence of *N*-Boc proline (4.5 mM). The absorbance of the solutions are kept similar at the excitation wavelength  $\lambda_{\text{ex}} = 340$  nm. (B) Corresponding emission lifetime decay profiles obtained using an excitation wavelength  $\lambda_{\text{ex}} = 355$  nm and monitoring emission at 495 nm. The lifetime decays are described using a mono-exponential decay function with a lifetime component of 1.09 and 1.35  $\mu\text{s}$  in the absence and presence of *N*-Boc proline, respectively. The results indicate that **1** is not quenched by *N*-Boc proline.

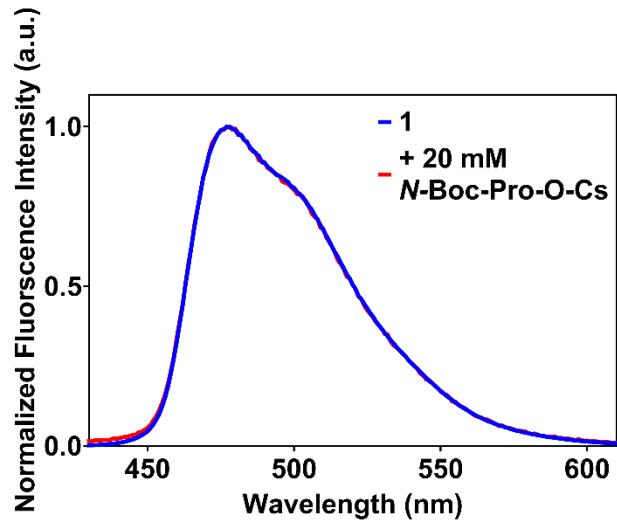

**Fig. S16** Emission spectra of (A) **1** (30 μM) and (C) **2** (30 μM) in the absence and presence of various concentrations of *N*-Boc-Pro-OCs (0.167 – 5 mM) in degassed DMF. The absorbance of the solutions are kept similar at the excitation wavelength  $\lambda_{\text{ex}} = 340$  nm. Emission lifetime decay profiles of (B) **1** (30 μM) and (D) **2** (30 μM) in the absence and presence of various concentrations of *N*-Boc-Pro-OCs (0.167 – 5 mM) in degassed DMF. The excitation wavelength  $\lambda_{\text{ex}} = 355$  nm and emission monitored at  $\lambda_{\text{em}} = 495$  nm. The lifetime decays are described by a mono-exponential decay function.

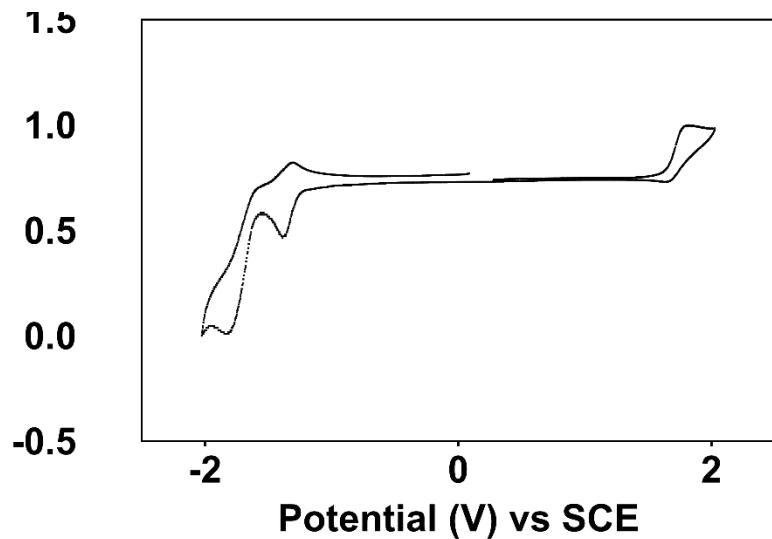

**Fig. S17** Stern-Volmer plots for **1** and **2** in the presence of *N*-Boc-Pro-OCs (0.167 – 5 mM) based on the data presented in Fig. S16†.

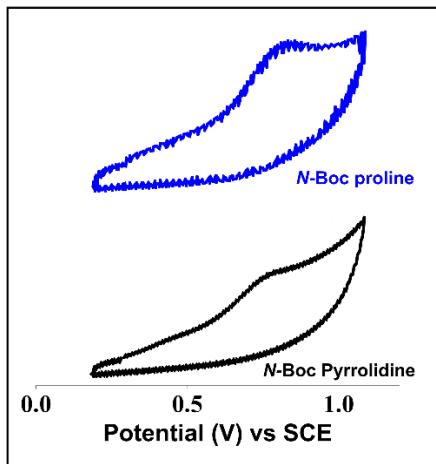

**Fig. S18** Normalized absorption spectra of **Ir-mod** ( $t_{\text{irra}} = 8$  h) in the absence of presence of 20 mM *N*-Boc-Pro-OCs. Solvent is DMF.

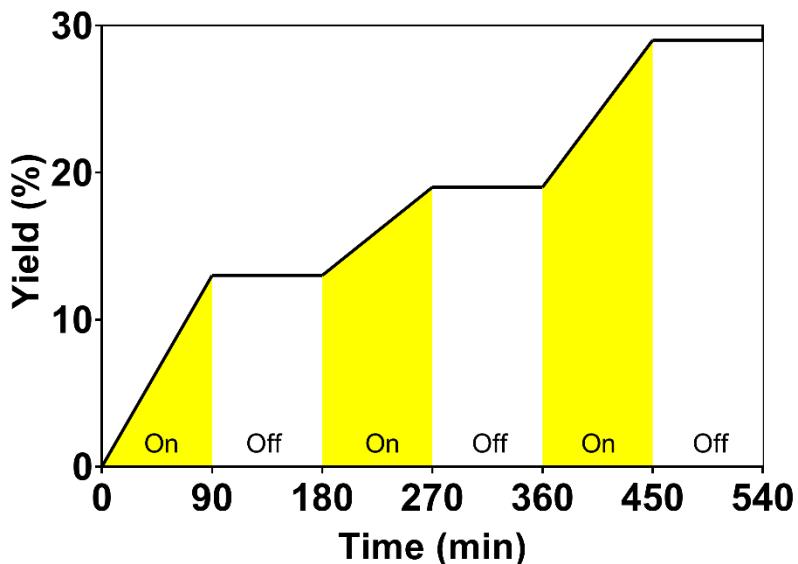

**Fig. S19** Normalized emission spectra of **1** in the absence of presence of 20 mM *N*-Boc-Pro-OCs. Solvent is degassed DMF and  $\lambda_{\text{ex}} = 340$  nm.

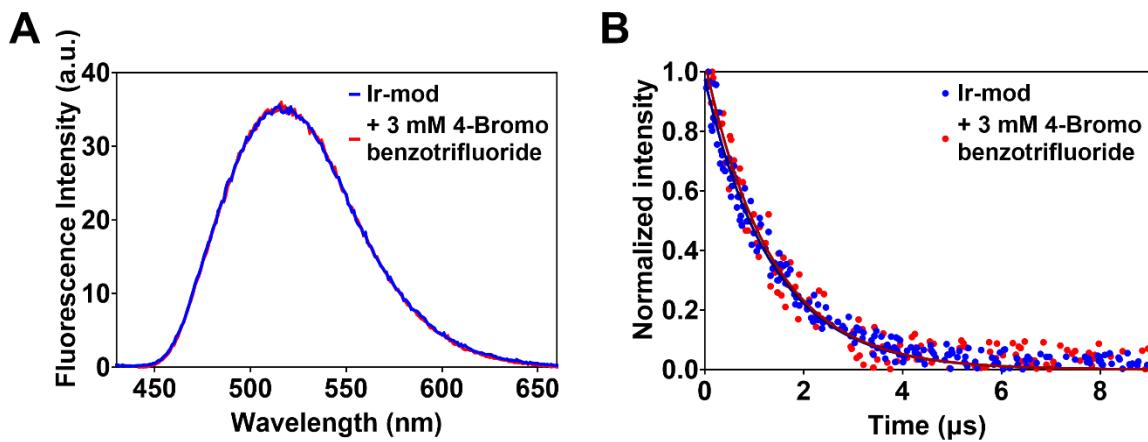

**Fig. S20** Cyclic voltammetry of **1** in degassed ACN.  $E_{\frac{1}{2}}(\text{ox}) = +1.71$  V vs. SCE and  $E_{\frac{1}{2}}(\text{red}) = -1.35$  and -1.73 V vs. SCE.

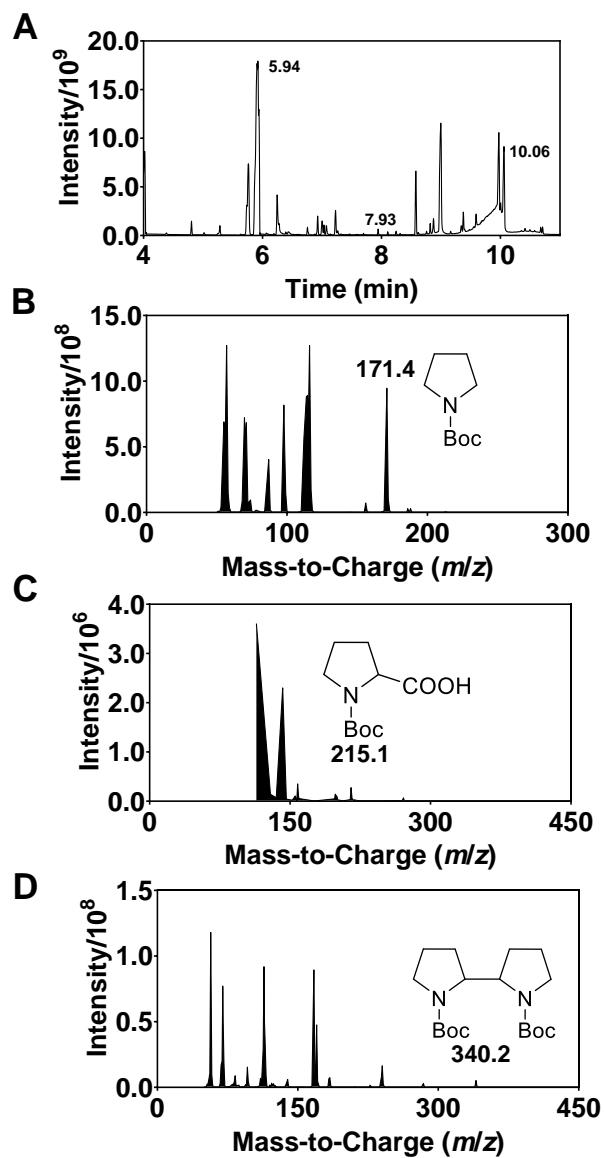

**Fig. S21** Cyclic voltammetry of *N*-Boc proline and *N*-Boc pyrrolidine in DMF with  $E_{1/2}(\text{ox}) = +0.82$  V *vs.* SCE and  $+0.77$  V *vs.* SCE, respectively.

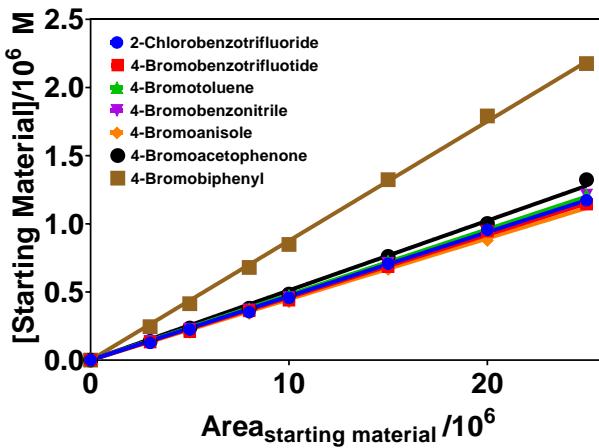

**Fig. S22** Plot of product yield (%) *vs.* time for the light on-off experiment. The product yield of the reaction after turning on and off a 456-nm lamp (40 W) that is used to irradiate a degassed DMF solution of 4-bromobenzotrifluoride, **1**, *N*-Boc proline and  $\text{Cs}_2\text{CO}_3$  is obtained from  $^{19}\text{F}$  NMR.

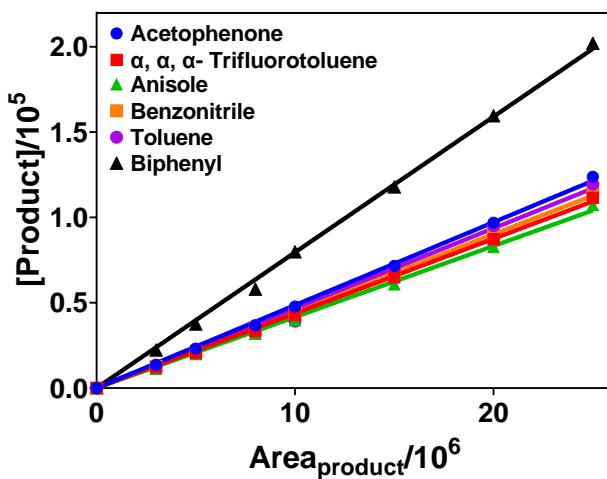

**Fig. S23** (A) Emission spectra of degassed DMF solutions of **Ir-mod** ( $t_{\text{irra}} = 8 \text{ h}$ ) in the absence and presence of 4-bromobenzotrifluoride (3 mM). The absorbance of the solutions are kept similar at the excitation wavelength  $\lambda_{\text{ex}} = 340 \text{ nm}$ . (B) Corresponding emission lifetime decay profiles. Excitation wavelength is 355 nm and emission monitored at 530 nm. The lifetime decays are described using a mono-exponential decay function with a lifetime component of  $1.35 \mu\text{s}$  for both in the absence and presence of 4-bromobenzotrifluoride (3 mM). The results indicate that **Ir-mod** is not quenched by 4-bromobenzotrifluoride.

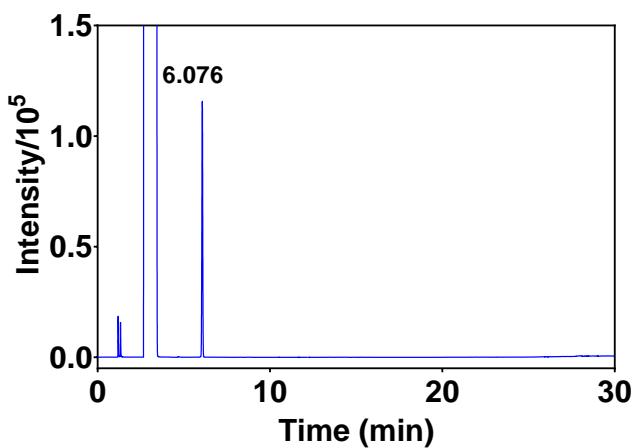

**Fig. S24** (A) GC-MS chromatogram of the crude reaction mixture of the hydrodehalogenation reaction of 4-bromoanisole in the presence of **1**, *N*-Boc proline,  $\text{Cs}_2\text{CO}_3$  and 456-nm light irradiation for 24 h. The peaks at 5.94, 7.93 and 10.06 min correspond to the mass spectra of *N*-Boc pyrrolidine ( $m/z = 171.4$ ) (B), *N*-Boc proline ( $m/z = 215.1$ ) (C) and dimeric *N*-Boc pyrrolidine ( $m/z = 340.2$ ) (D).

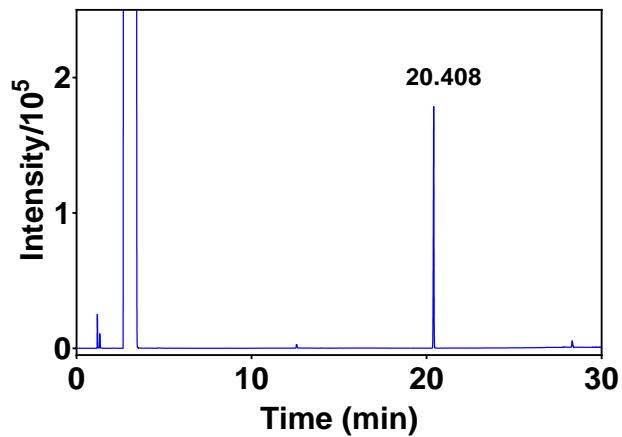

**Fig. S25** GC-FID calibration graphs for standard aryl halides used in this study. The gradients ( $R^2$ ) from a linear fit are 0.0469 (0.999), 0.0511 (0.999), 0.0460 (0.999), 0.0446 (0.999), 0.0476 (0.999), 0.0480 (0.997) and 0.0876 (0.999) for 2-chlorobenzotrifluoride, 4-bromoacetophenone, 4-bromobenzotrifluoride, 4-bromoanisole, 4-bromobenzonitrile, 4-bromotoluene and 4-bromobiphenyl, respectively

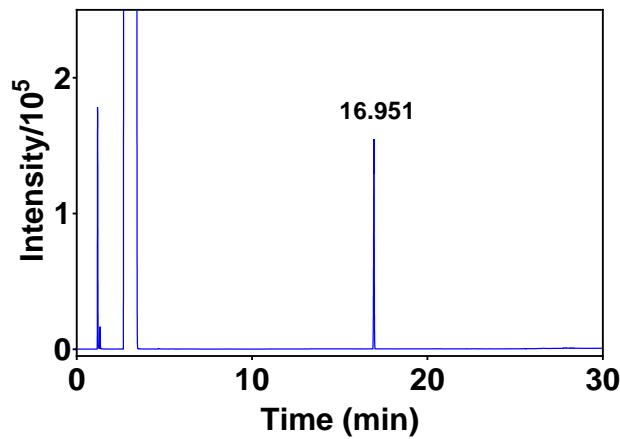

**Fig. S26** GC-FID calibration graphs for the standard hydrodehalogenation products. The gradients ( $R^2$ ) from a linear fit are 0.0486 (0.999), 0.0438 (0.999), 0.0416 (0.998), 0.0451 (0.999), 0.0468 (0.997) and 0.0795 (0.999) for acetophenone,  $\alpha, \alpha, \alpha$ -trifluorotoluene, anisole, benzonitrile, toluene and biphenyl, respectively.

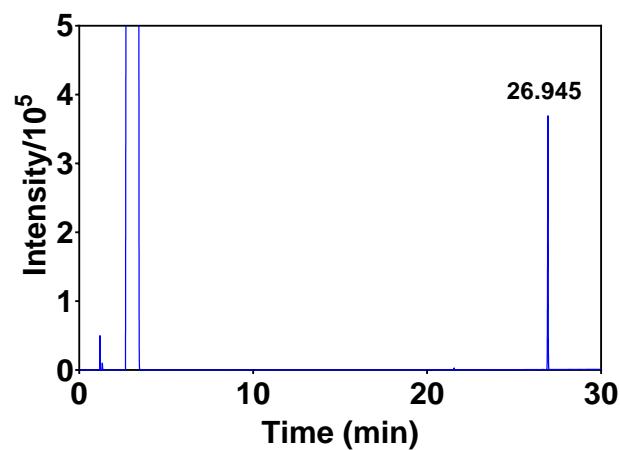

**Fig. S27** GC chromatogram of a standard 4-bromobenzotrifluoride (6.076 min).

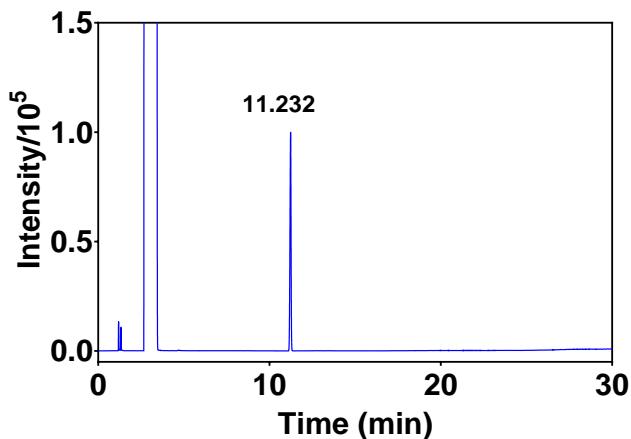

**Fig. S28** GC chromatogram of a standard 4-bromoacetophenone (20.408 min).

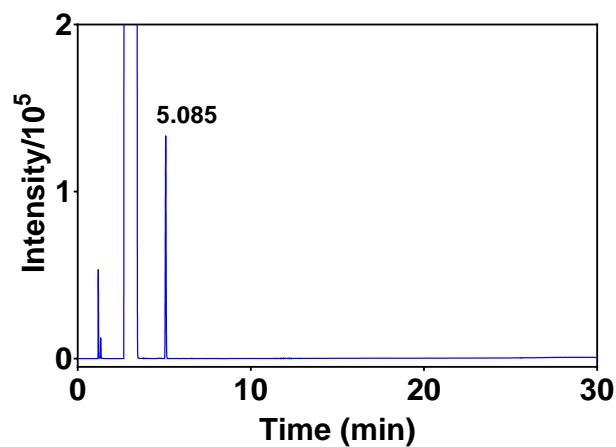

**Fig. S29** GC chromatogram of a standard 4-bromoanisole (16.951 min).

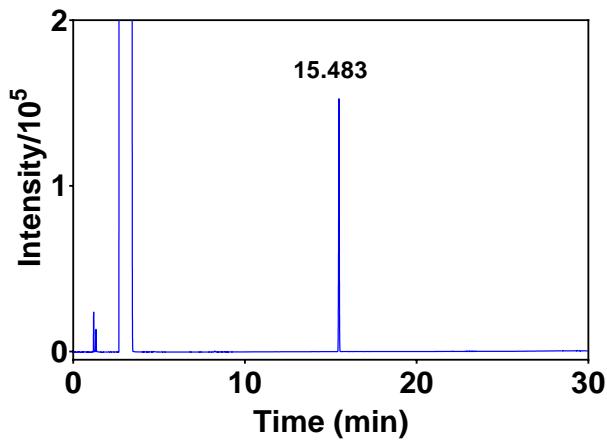

**Fig. S30** GC chromatogram of a standard 4-bromobiphenyl (26.945 min).

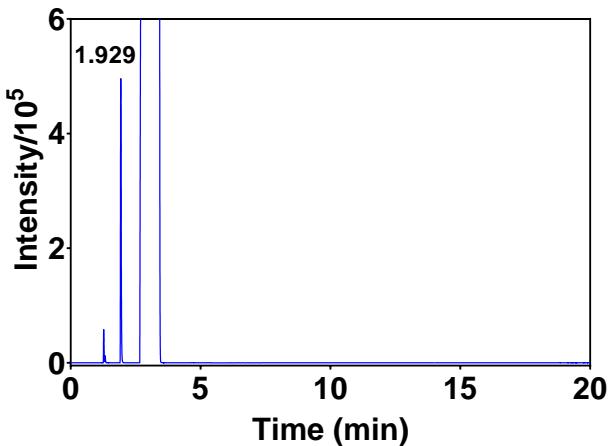

**Fig. S31** GC chromatogram of a standard 4-bromotoluene (11.232 min).

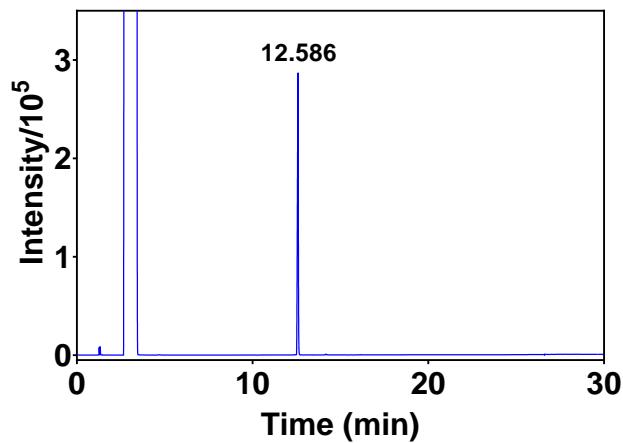

**Fig. S32** GC chromatogram of a standard 2-chlorobenzotrifluoride (5.085 min).

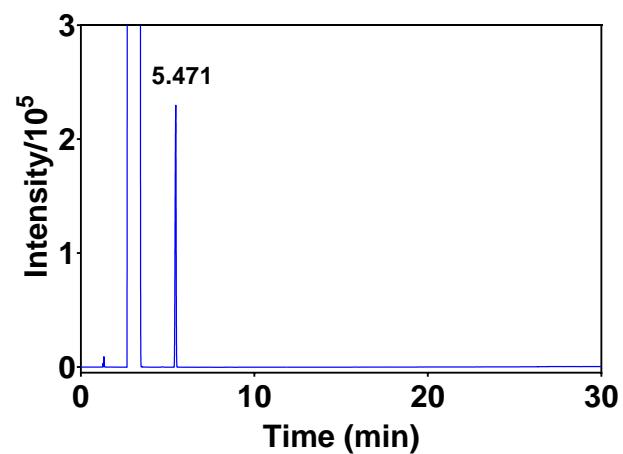

**Fig. S33** GC chromatogram of a standard 4-chlorobenzonitrile (15.483 min).

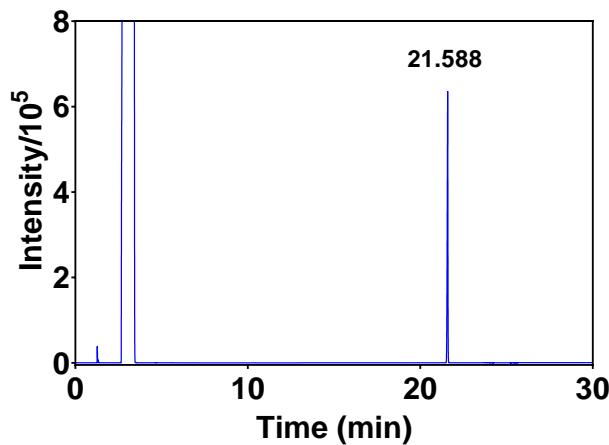

**Fig. S34** GC chromatogram of a standard  $\alpha,\alpha,\alpha$ -trifluorotoluene (1.929 min).

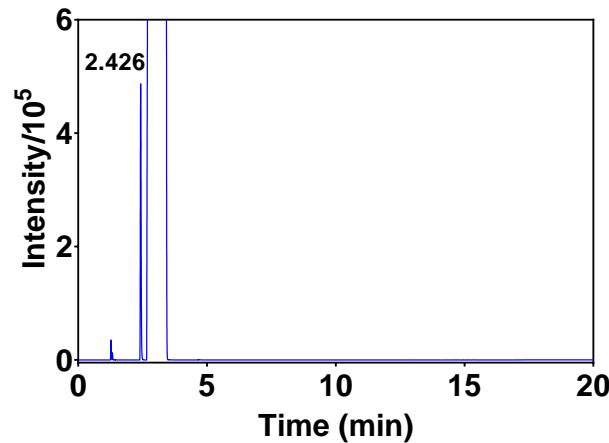

**Fig. S35** GC chromatogram of a standard acetophenone (12.586 min).

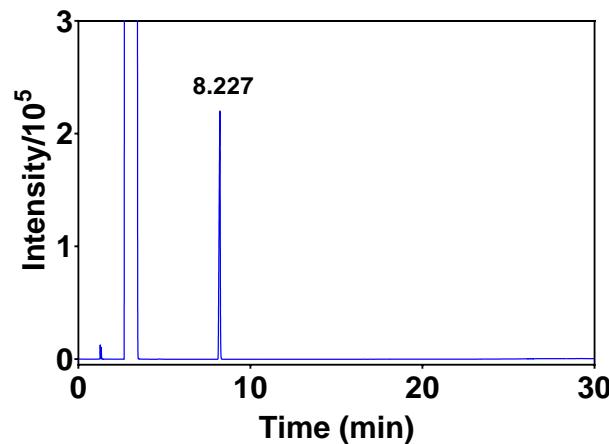

**Fig. S36** GC chromatogram of a standard anisole (5.471 min).

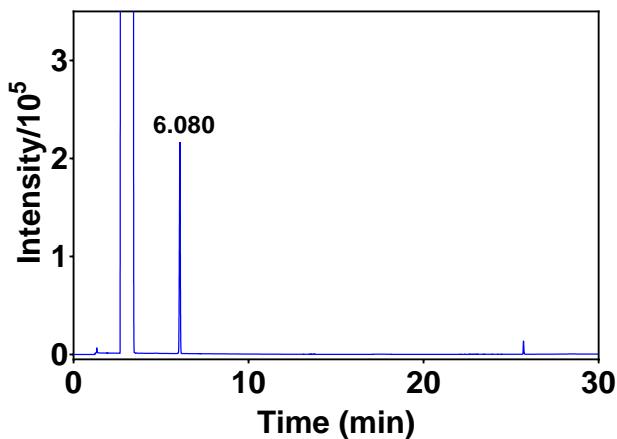

**Fig. S37** GC chromatogram of a standard biphenyl (21.588 min).

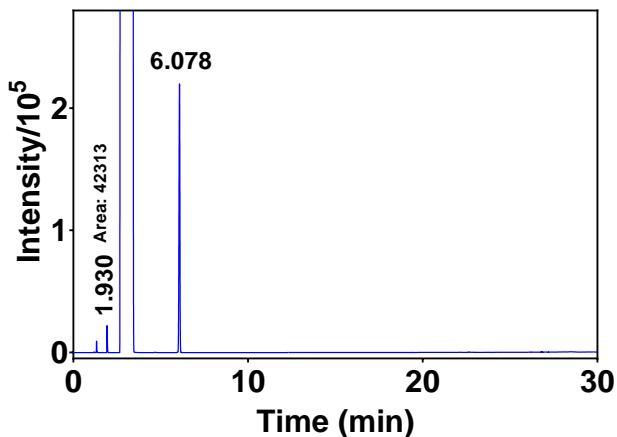

**Fig. S38** GC chromatogram of a standard toluene (2.426 min).

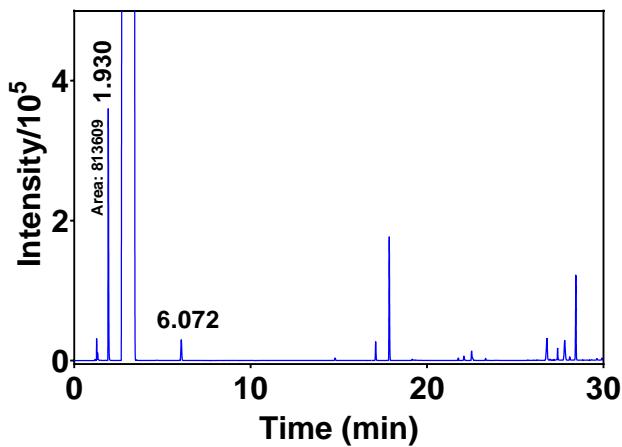

**Fig. S39** GC chromatogram of a standard benzonitrile (8.227 min).

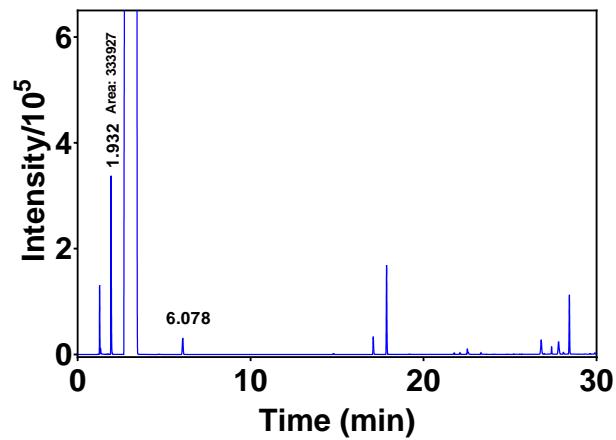

**Fig. S40** GC chromatogram of the hydrodehalogenation reaction of 4-bromobenzotrifluoride in the absence of iridium complex and *N*-Boc proline, and presence of  $\text{Cs}_2\text{CO}_3$  and 456-nm light irradiation for 24 h (entry 1, Table 3). The peak at 6.080 min corresponds to 4-bromobenzotrifluoride.

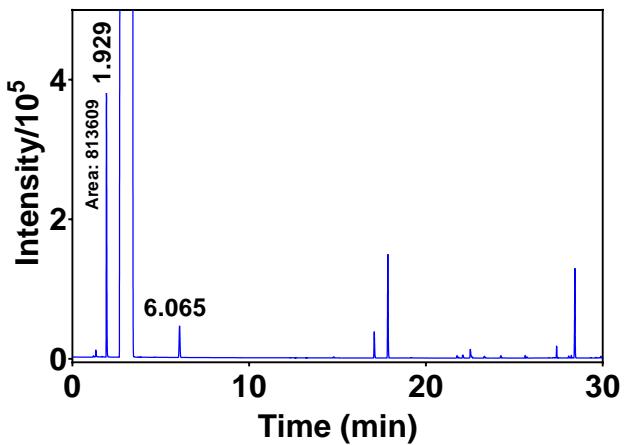

**Fig. S41** GC chromatogram of the hyrdodehalogenation reaction of 4-bromobenzotrifluoride in the presence of **1**,  $\text{Cs}_2\text{CO}_3$  and 456-nm light irradiation for 24 h, and absence of *N*-Boc proline (entry 2, Table 3). The peaks at 1.930 and 6.078 min corresponds to  $\alpha,\alpha,\alpha$ -trifluorotoluene and 4-bromobenzotrifluoride, respectively.

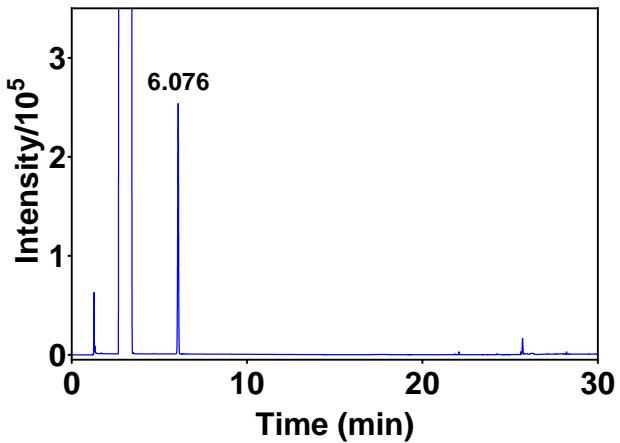

**Fig. S42** GC chromatogram of the hydrodehalogenation reaction of 4-bromobenzotrifluoride in the presence of **1**, *N*-Boc proline, Cs<sub>2</sub>CO<sub>3</sub> and 456-nm light irradiation for 24 h (entry 3, Table 3). The peak at 1.930 and 6.072 min corresponds to  $\alpha,\alpha,\alpha$ -trifluorotoluene and 4-bromobenzotrifluoride, respectively.

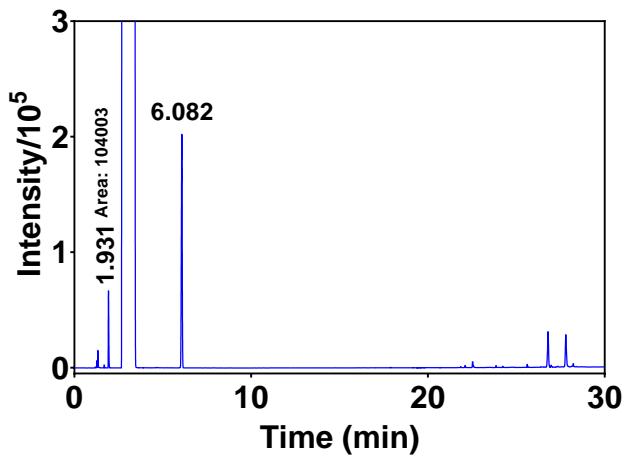

**Fig. S43** GC chromatogram of the hydrodehalogenation reaction of 4-bromobenzotrifluoride in the presence of **2**, *N*-Boc proline, Cs<sub>2</sub>CO<sub>3</sub> and 456-nm light irradiation for 24 h (entry 4, Table 3). The peak at 1.932 and 6.078 correspond to  $\alpha,\alpha,\alpha$ -trifluorotoluene and 4-bromobenzotrifluoride, respectively.

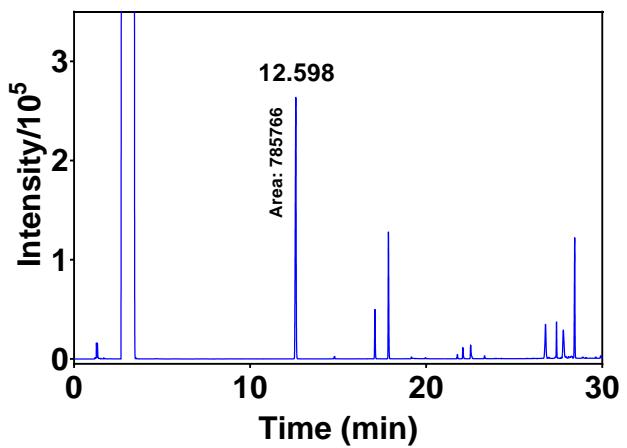

**Fig. S44** GC chromatogram of the hydrodehalogenation reaction of 4-bromobenzotrifluoroide in the presence of **Ir-mod** ( $t_{\text{irra}} = 8 \text{ h}$ ), *N*-Boc proline,  $\text{Cs}_2\text{CO}_3$  and 456-nm light irradiation for 24 h (entry 5, Table 3). The peaks at 1.929 and 6.065 min correspond to  $\alpha,\alpha,\alpha$ -trifluorotoluene and 4-bromobenzotrifluoride, respectively.

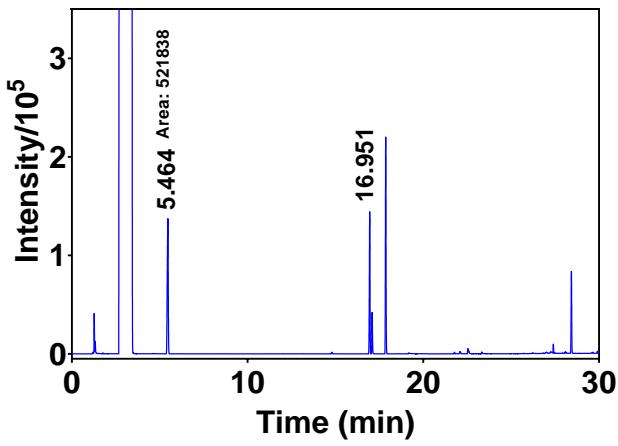

**Fig. S45** GC chromatogram of the hyrdodehalogenation reaction of 4-bromobenzotrifluoride in the presence of **Ir-mod** ( $t_{\text{irra}} = 8 \text{ h}$ ), *N*-Boc proline and  $\text{Cs}_2\text{CO}_3$  in the dark (entry 6, Table 3). The peak at 6.078 min corresponds to 4-bromobenzotrifluoride.

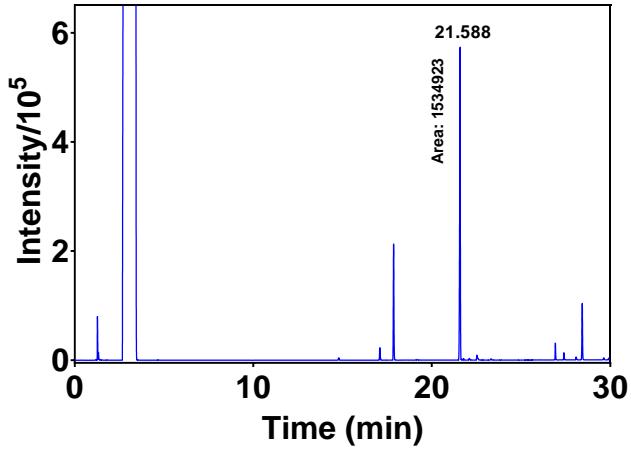

**Fig. S46** GC chromatogram of the hyrdodehalogenation reaction of 4-bromobenzotrifluoride in the presence of **Ir-mod** ( $t_{\text{irra}} = 8 \text{ h}$ ),  $\text{Cs}_2\text{CO}_3$  and 456-nm light irradiation for 24 h, and absence of *N*-Boc proline (entry 7, Table 3). The peaks at 1.931, 6.082 min correspond to  $\alpha,\alpha,\alpha$ -trifluorotoluene and 4-bromobenzotrifluoride.

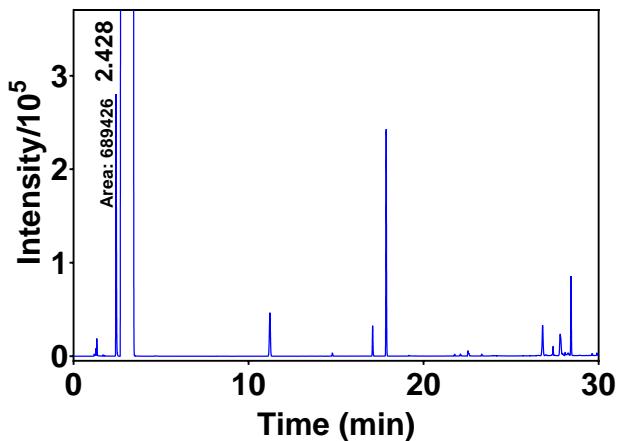

**Fig. S47** GC chromatogram of the hydrodehalogenation reaction of 4-bromoacetophenone (Table 4) in the presence of **1**, *N*-Boc proline,  $\text{Cs}_2\text{CO}_3$  and 456-nm light irradiation for 24 h. The peak at 12.598 min corresponds to acetophenone.

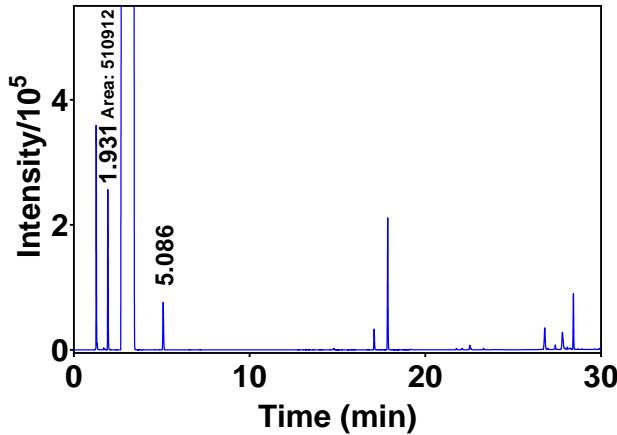

**Fig. S48** GC chromatogram of the hydrodehalogenation reaction of 4-bromoanisole (Table 4) in the presence of **1**, *N*-Boc proline, Cs<sub>2</sub>CO<sub>3</sub> and 456-nm light irradiation for 24 h. The peaks at 5.464 and 16.951 min correspond to anisole and 4-bromoanisole, respectively.

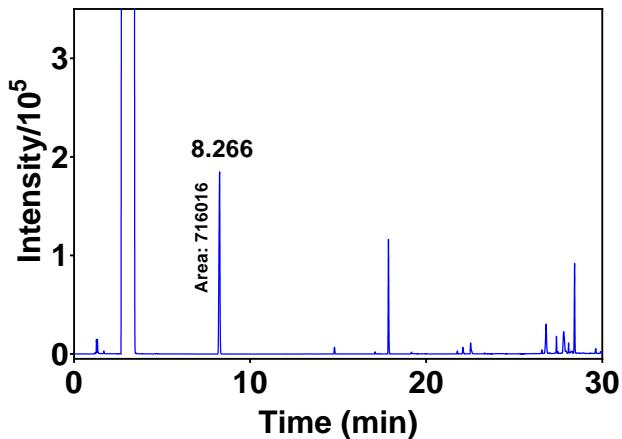

**Fig. S49** GC chromatogram of the hydrodehalogenation reaction of 4-bromobiphenyl (Table 4) in the presence of **1**, *N*-Boc proline, Cs<sub>2</sub>CO<sub>3</sub> and 456-nm light irradiation for 24 h. The peak at 21.588 min corresponds to biphenyl.

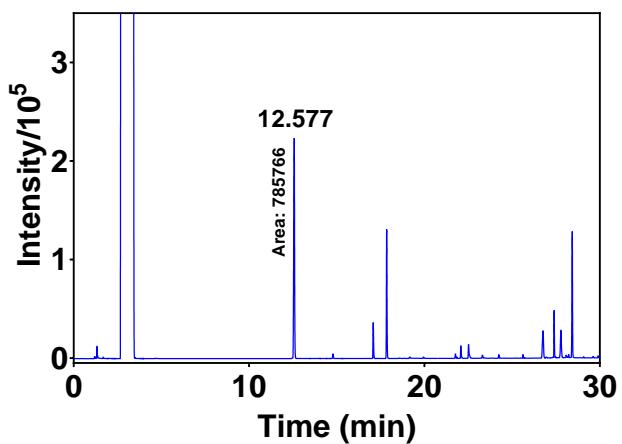

**Fig. S50** GC chromatogram of the hydrodehalogenation reaction of 4-bromotoluene (Table 4) in the presence of **1**, *N*-Boc proline, Cs<sub>2</sub>CO<sub>3</sub> and 456-nm light irradiation for 24. The peak at 2.428 min corresponds to toluene.

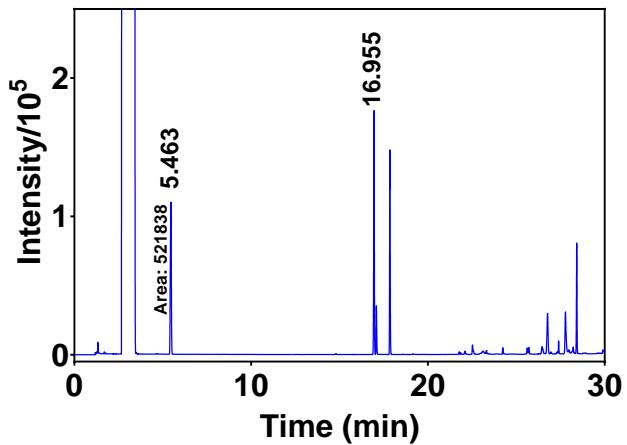

**Fig. S51** GC chromatogram of the hydrodehalogenation reaction of 2-chlorobenzotrifluoride (Table 4) in the presence of **1**, *N*-Boc proline, Cs<sub>2</sub>CO<sub>3</sub> and 456-nm light irradiation for 24 h. The peaks at 1.931 and 5.086 min corresponds to  $\alpha,\alpha,\alpha$ -trifluorotoluene and 2-chlorobenzotrifluoride, respectively.

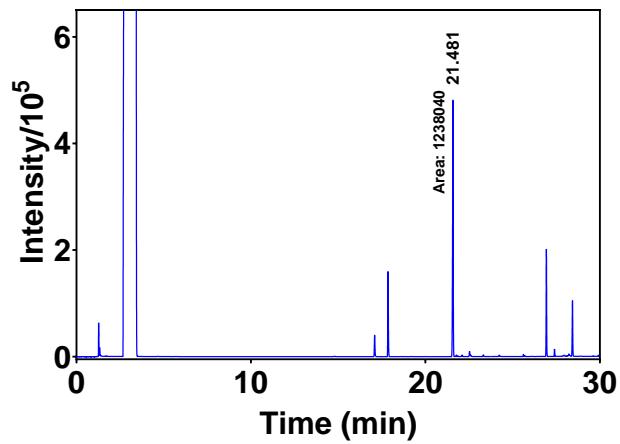

**Fig. S52** GC chromatogram of the hydrodehalogenation reaction of 4-chlorobenzonitrile (Table 4) in the presence of **1**, *N*-Boc proline, Cs<sub>2</sub>CO<sub>3</sub> and 456-nm light irradiation for 24 h. The peak at 8.266 corresponds to benzonitrile.

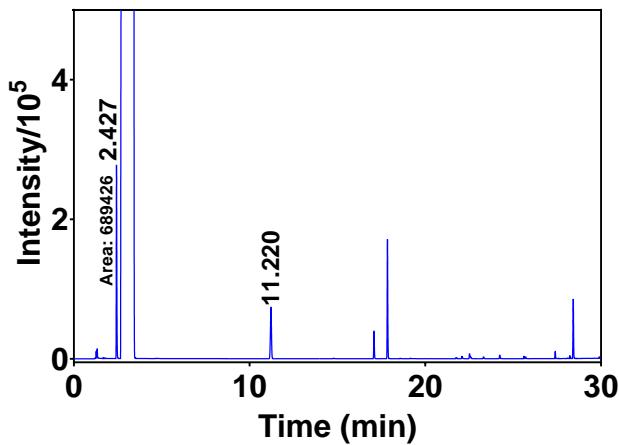

**Fig. S53** GC chromatogram of the hydrodehalogenation reaction of 4-bromoacetophenone (Table 4) in the presence of **Ir-mod** ( $t_{\text{irra}} = 8$  h), *N*-Boc proline, Cs<sub>2</sub>CO<sub>3</sub> and 456-nm light irradiation for 24 h. The peak at 12.577 min correspond to acetophenone.

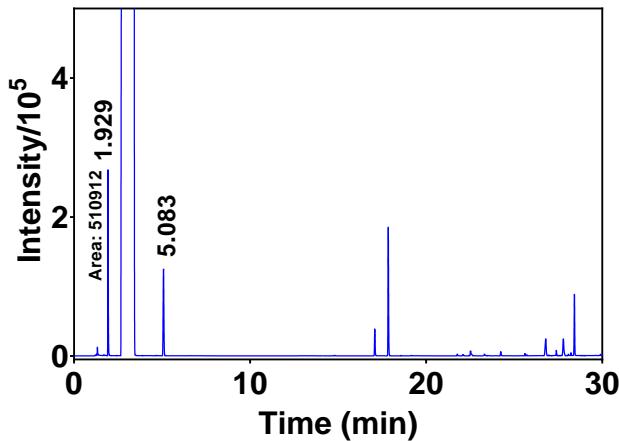

**Fig. S54** GC chromatogram of the hydrodehalogenation reaction of 4-bromoanisole (Table 4) in the presence of **Ir-mod** ( $t_{\text{irra}} = 8 \text{ h}$ ), *N*-Boc proline,  $\text{Cs}_2\text{CO}_3$  and 456-nm light irradiation for 24 h. The peaks at 5.463 and 16.955 correspond to anisole and 4-bromoanisole, respectively.

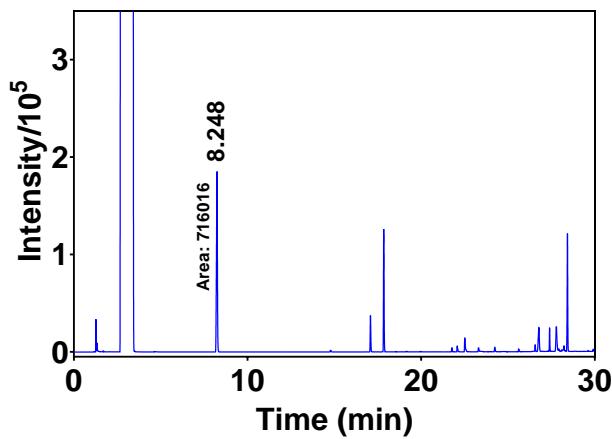

**Fig. S55** GC chromatogram of the hydrodehalogenation reaction of 4-bromobiphenyl (Table 4) in the presence of **Ir-mod** ( $t_{\text{irra}} = 8 \text{ h}$ ), *N*-Boc proline,  $\text{Cs}_2\text{CO}_3$  and 456-nm light irradiation for 24 h. The peak at 21.481 min corresponds to biphenyl.

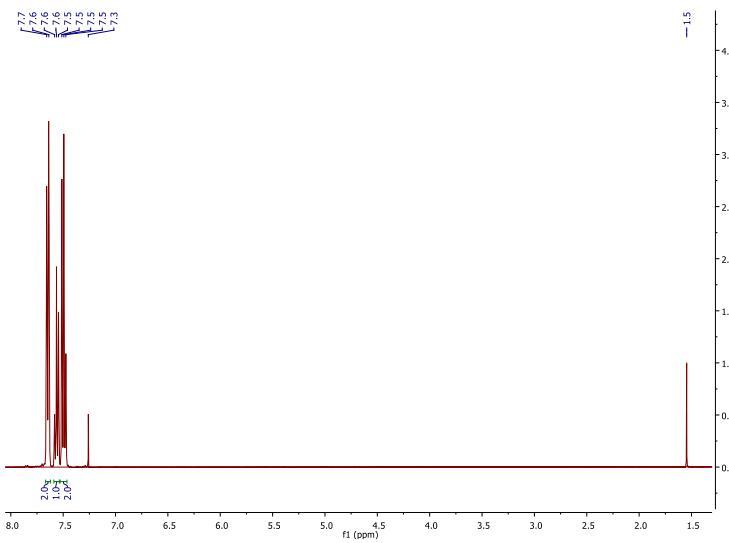

**Fig. S56** GC chromatogram of the hydrodehalogenation reaction of 4-bromotoluene (Table 4) in the presence of **Ir-mod** ( $t_{\text{irra}} = 8 \text{ h}$ ), *N*-Boc proline,  $\text{Cs}_2\text{CO}_3$  and 456-nm light irradiation for 24 h. The peaks at 2.428 and 11.220 min correspond to toluene and 4-bromotoluene, respectively.

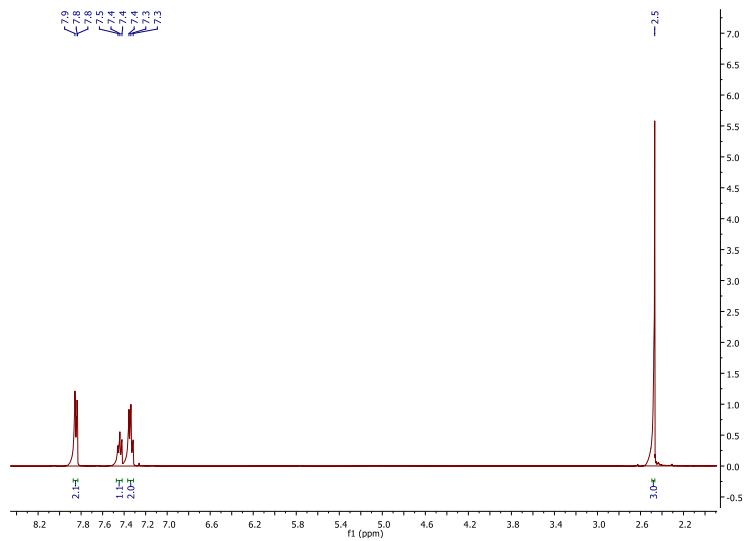

**Fig. S57** GC chromatogram of the hydrodehalogenation reaction of 2-chlorobenzotrifluoride (Table 4) in the presence of **Ir-mod** ( $t_{\text{irra}} = 8 \text{ h}$ ), *N*-Boc proline,  $\text{Cs}_2\text{CO}_3$  and 456-nm light irradiation for 24 h. The peaks at 1.929 and 5.083 min correspond to  $\alpha, \alpha, \alpha, \text{-trifluorotoluene}$  and 2-chlorobenzotrifluoride, respectively.

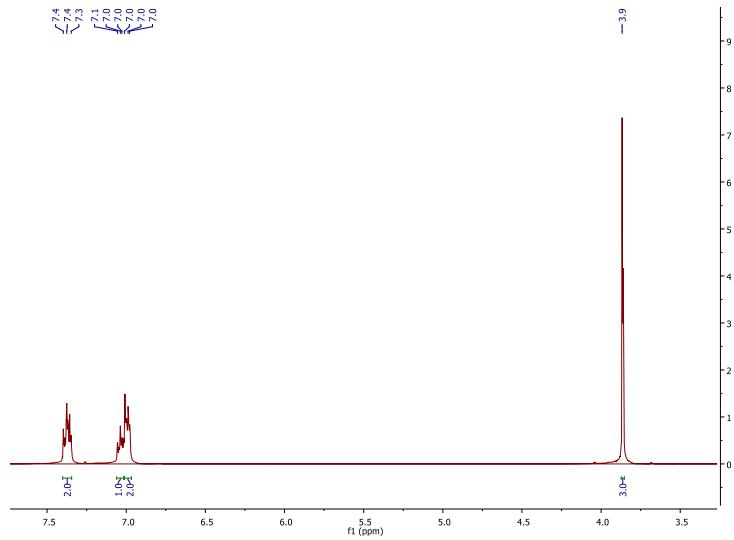

**Fig. S58** GC chromatogram of the hydrodehalogenation reaction of 4-chlorobenzonitrile (Table 4) in the presence of **Ir-mod** ( $t_{\text{irra}} = 8 \text{ h}$ ), *N*-Boc proline,  $\text{Cs}_2\text{CO}_3$  and 456-nm light irradiation for 24 h. The peak at 8.248 corresponds to benzonitrile.

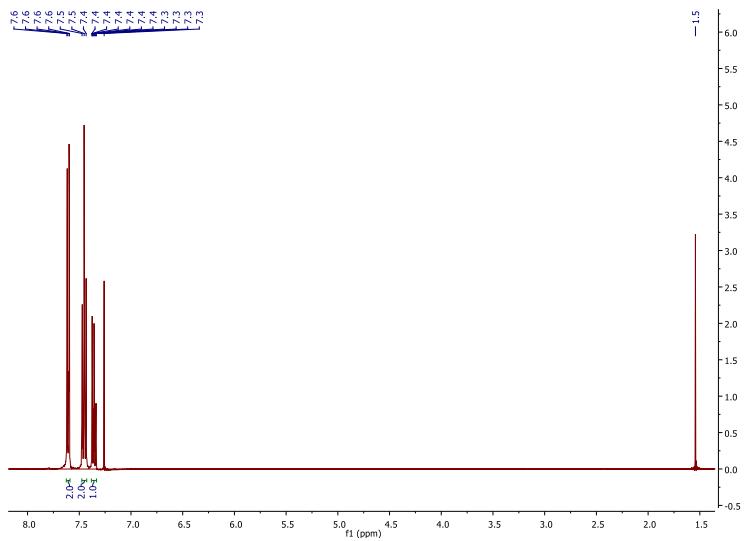

**Fig. S59**  $^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ ) of a standard  $\alpha,\alpha,\alpha$ -trifluorotoluene.

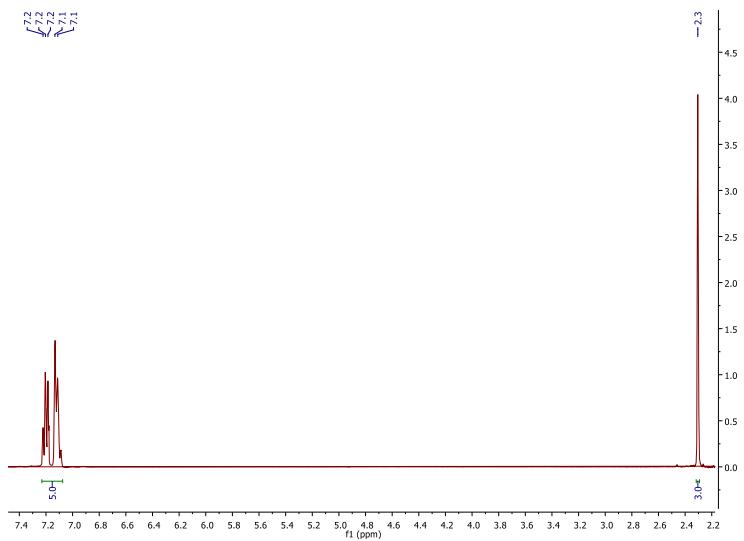

**Fig. S60**  $^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ ) of a standard acetophenone.

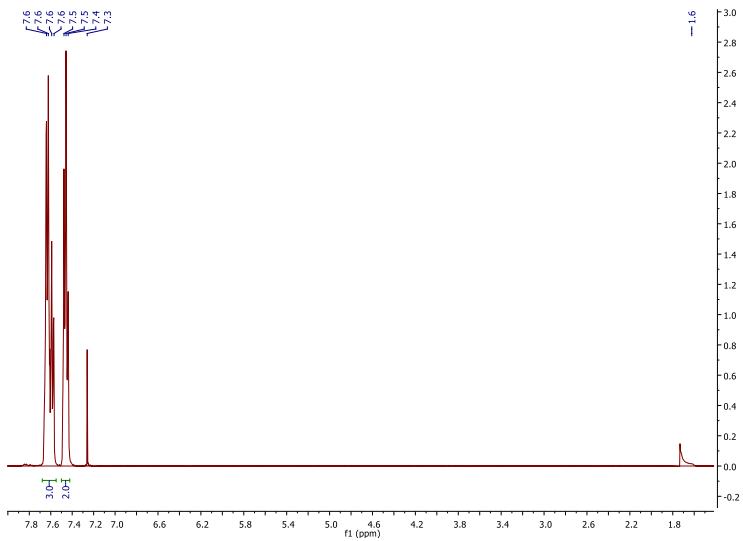

**Fig. S61**  $^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ ) of a standard anisole.

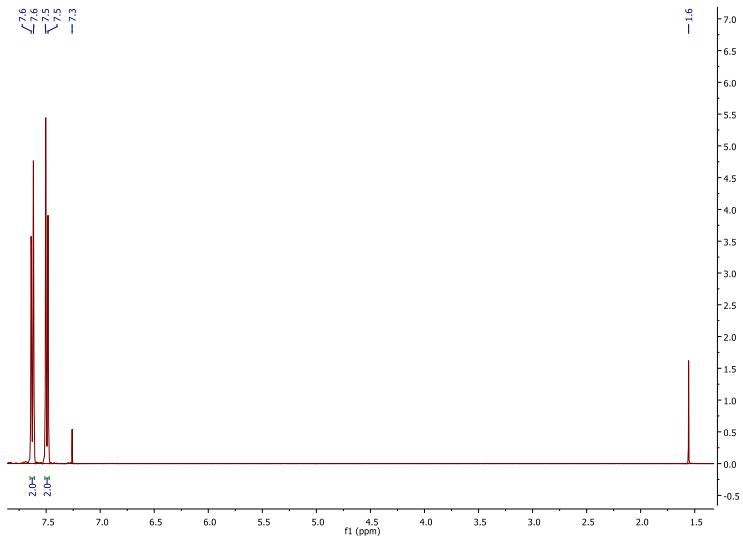

**Fig. S62**  $^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ ) of a standard biphenyl.

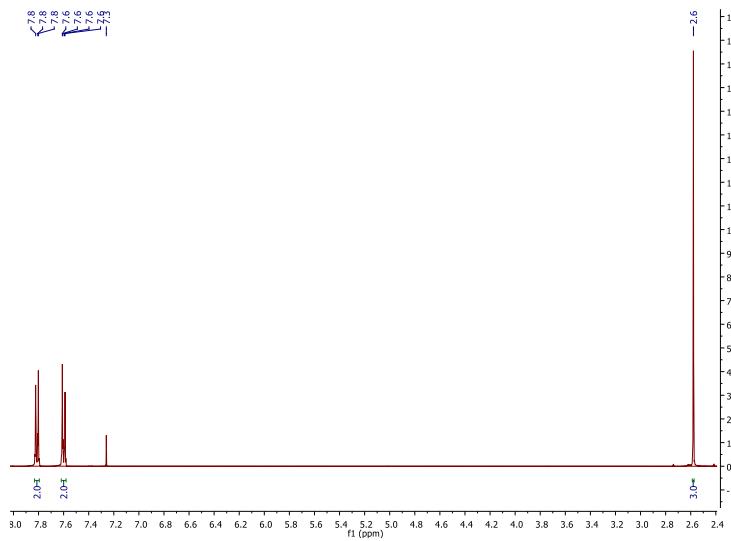

**Fig. S63**  $^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ ) of a standard toluene.

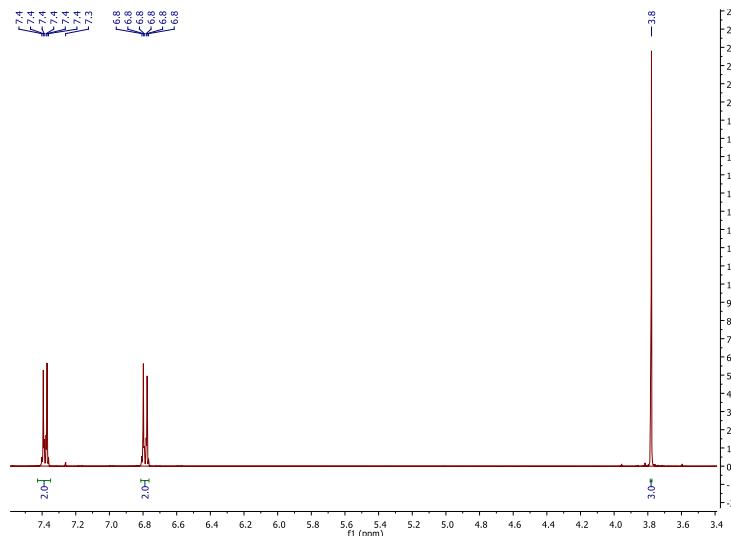

**Fig. S64** <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>) of a standard benzonitrile.

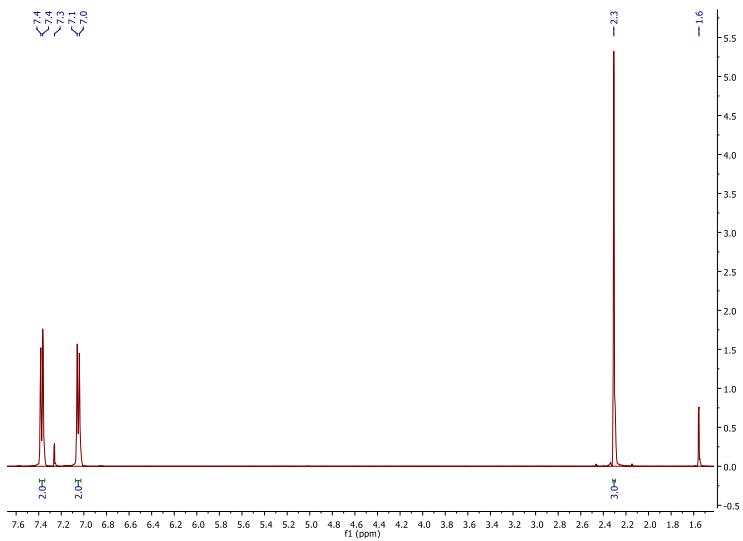

**Fig. S66** <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>) of a standard 4-bromoacetophenone

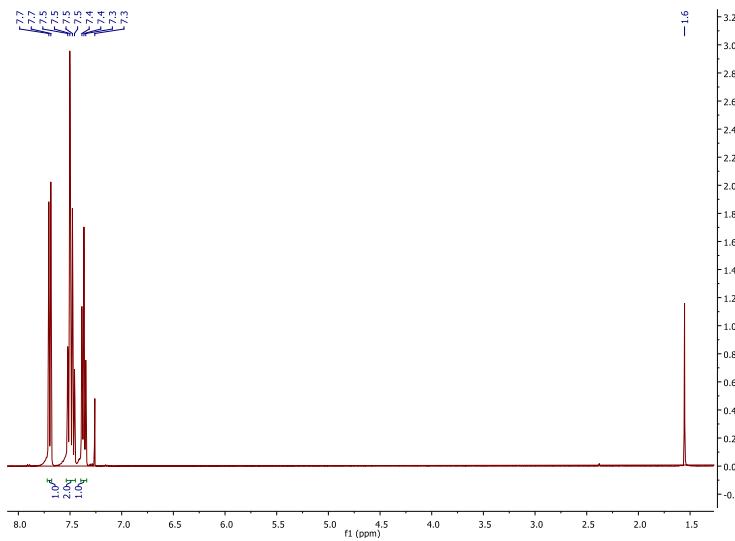

**Fig. S67** <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>) of a standard 4-bromoanisole.

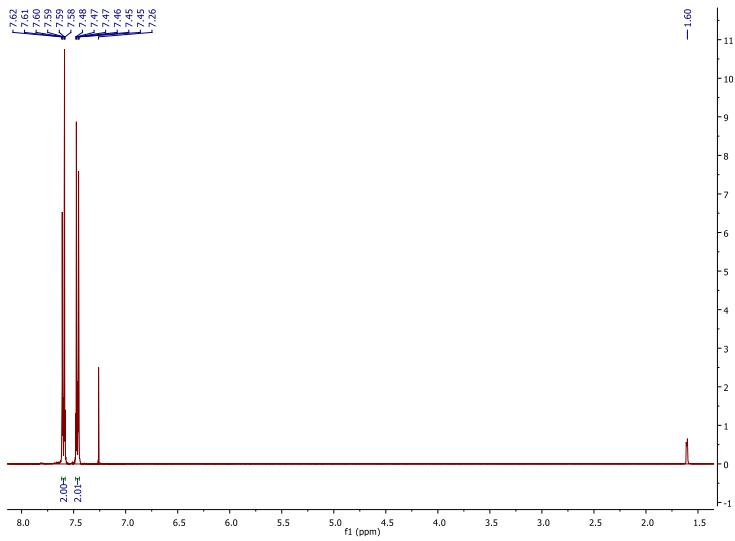

**Fig. S68**  $^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ ) of a standard 4-bromobiphenyl.

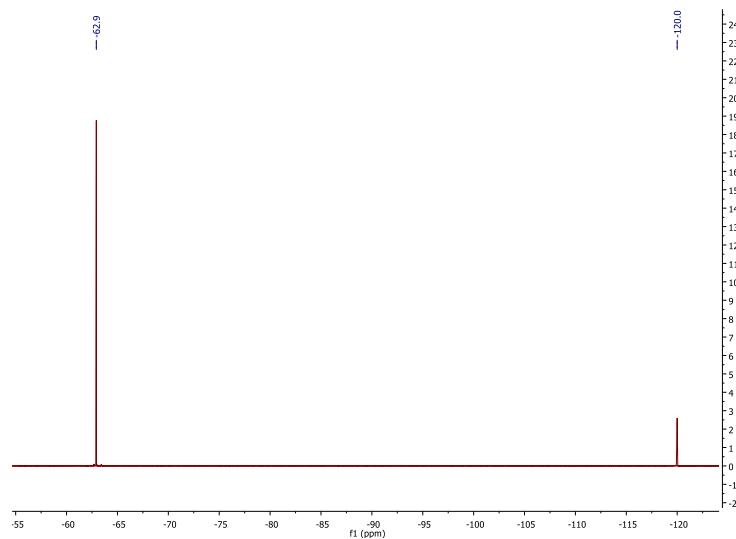

**Fig. S69**  $^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ ) of a standard 4-bromotoluene.

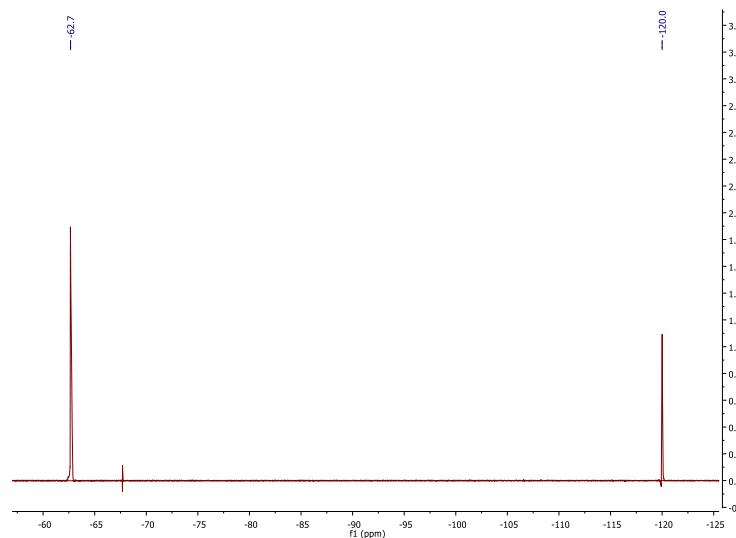

**Fig. S70**  $^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ ) of a standard 2-chlorobenzotrifluoride.

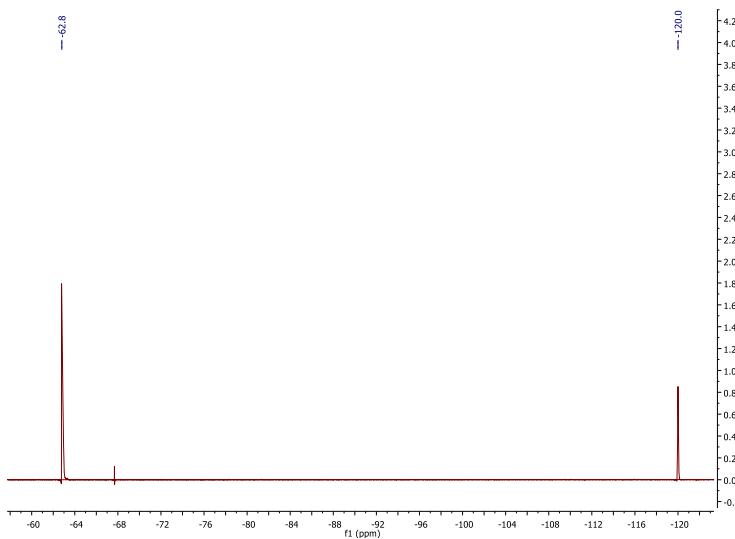

**Fig. S71**  $^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ ) of a standard 4-chlorobenzonitrile.

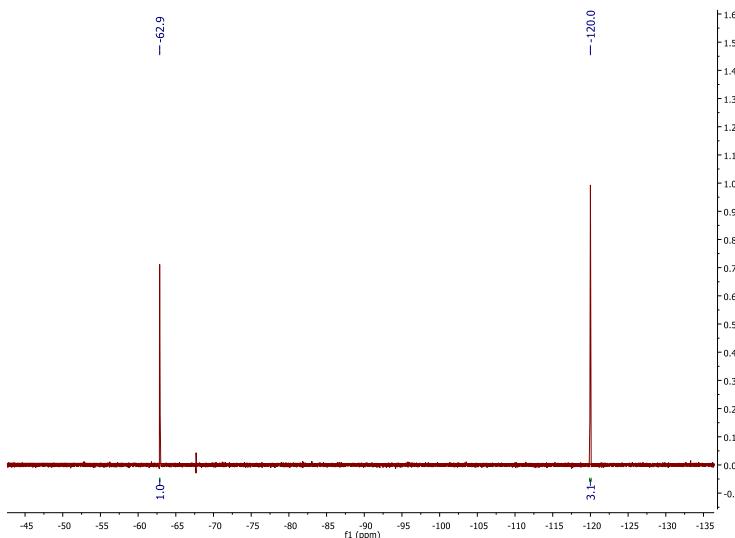

**Fig. S72** <sup>19</sup>F NMR (400 MHz, DMF, 4-fluorotoluene as internal standard) of a standard 4-bromobenzotrifluoride.

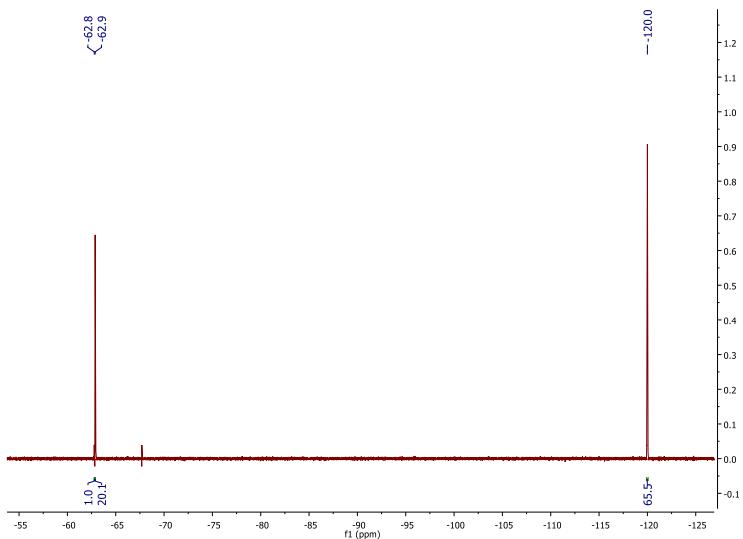

**Fig. S73** <sup>19</sup>F NMR (400 MHz, DMF, 4-fluorotoluene as internal standard) of a standard 2-chlorobenzotrifluoride.

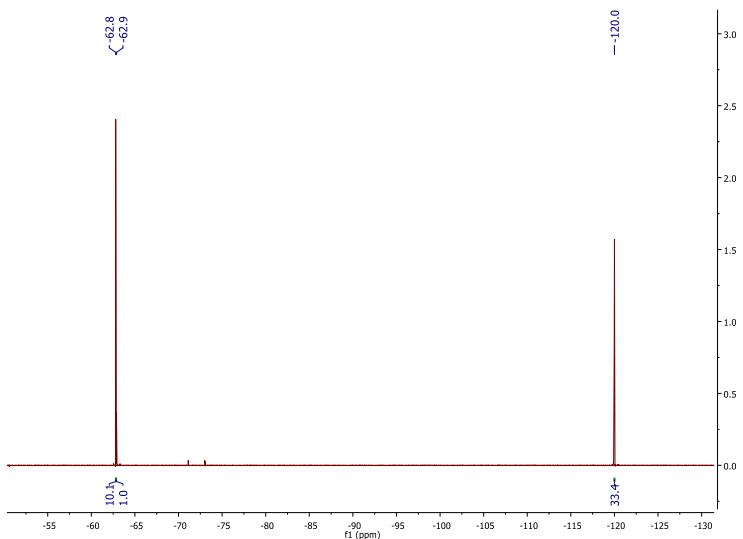

**Fig. S74**  $^{19}\text{F}$  NMR (400 MHz, DMF, 4-fluorotoluene as internal standard) of a standard  $\alpha,\alpha,\alpha$ -trifluorotoluene.

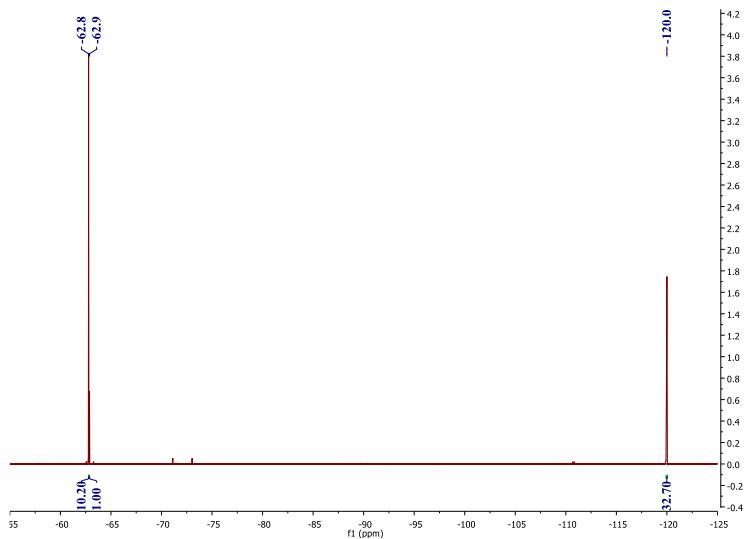

**Fig. S75**  $^{19}\text{F}$  NMR (400 MHz, DMF, 4-fluorotoluene as internal standard) of the hydrodehalogenation reaction of 4-bromobenzotrifluoride in the absence of iridium complex and *N*-Boc proline, and presence of  $\text{Cs}_2\text{CO}_3$  and 456-nm light irradiation for 24 h (entry 1, Table 4). The peaks at -62.9 and -120.0 ppm correspond to 4-bromobenzotrifluoride and 4-fluorotoluene, respectively.

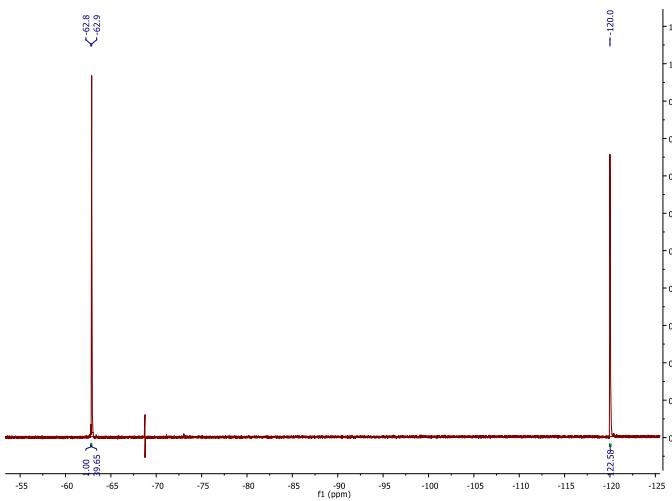

**Fig. S76**  $^{19}\text{F}$  NMR (400 MHz, DMF, 4-fluorotoluene as internal standard) of the hydrodehalogenation reaction of 4-bromobenzotrifluoride in the presence of **1**,  $\text{Cs}_2\text{CO}_3$  and 456-nm light irradiation for 24 h, and absence of *N*-Boc proline (entry 2, Table 4). The peaks at -62.8, -62.9 and -120.0 ppm correspond to  $\alpha,\alpha,\alpha$ -trifluorotoluene, 4-bromobenzotrifluoride and 4-fluorotoluene, respectively.

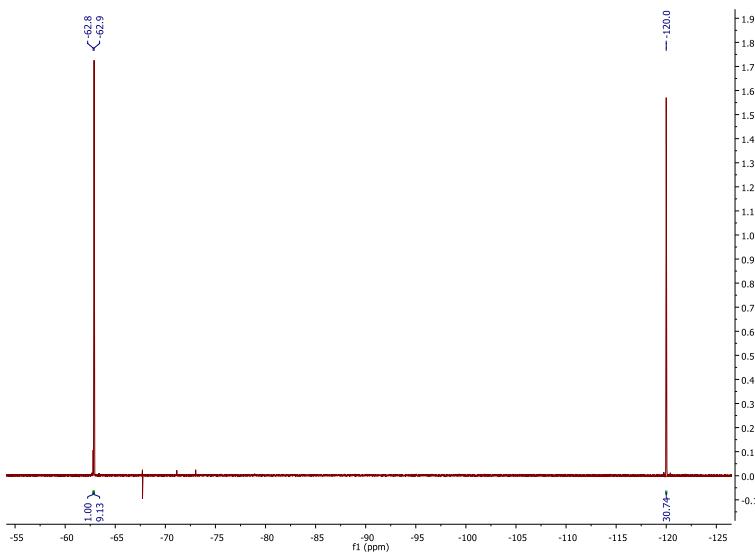

**Fig. S77**  $^{19}\text{F}$  NMR (400 MHz, DMF, 4-fluorotoluene as internal standard) of the hydrodehalogenation reaction of 4-bromobenzotrifluoride of **1**, *N*-Boc proline,  $\text{Cs}_2\text{CO}_3$  and 456-nm light irradiation for 24 h (entry 3, Table 5). The peak at -62.8, -62.9 and -120.0 correspond to  $\alpha,\alpha,\alpha$ -trifluorotoluene, 4-bromobenzotrifluoride and 4-fluorotoluene, respectively

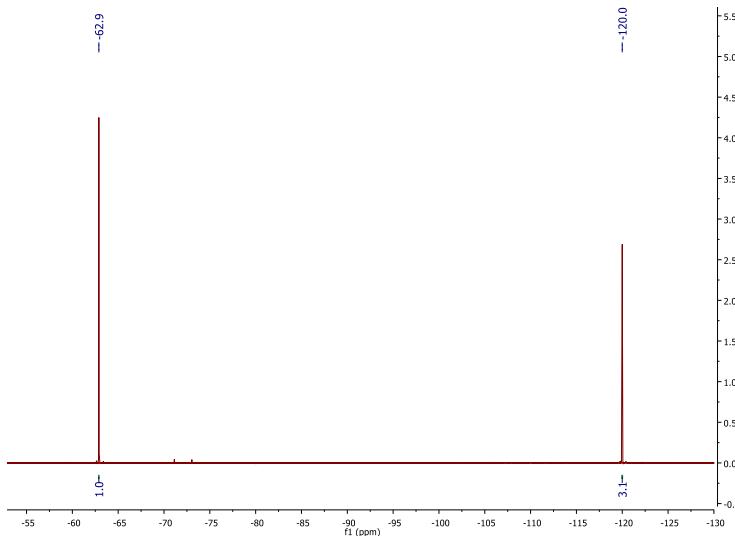

**Fig. S78**  $^{19}\text{F}$  NMR (400 MHz, DMF, 4-fluorotoluene as internal standard) of the hydrodehalogenation reaction of 4-bromobenzotrifluoride in the presence of **2**, *N*-Boc proline,  $\text{Cs}_2\text{CO}_3$  and 456-nm light irradiation for 24 h (entry 4, Table 5). The peaks at -62.8, -62.9 and -120.0 ppm correspond to  $\alpha,\alpha,\alpha$ -trifluorotoluene, 4-bromobenzotrifluoride and 4-fluorotoluene, respectively.

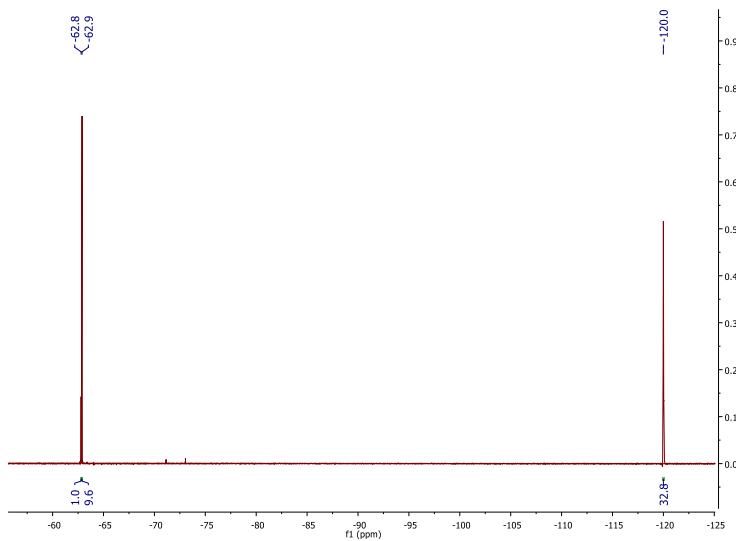

**Fig. S79**  $^{19}\text{F}$  NMR (400 MHz, DMF, 4-fluorotoluene as internal standard) of the hydrodehalogenation reaction of 4-bromobenzotrifluoride in the absence of *N*-Boc proline and  $\text{Cs}_2\text{CO}_3$ , and presence of **2** and 456-nm light irradiation for 24 h. The peaks at -62.8, -62.9 and -120.0 ppm correspond to  $\alpha,\alpha,\alpha$ -trifluorotoluene, 4-bromobenzotrifluoride and 4-fluorotoluene, respectively.

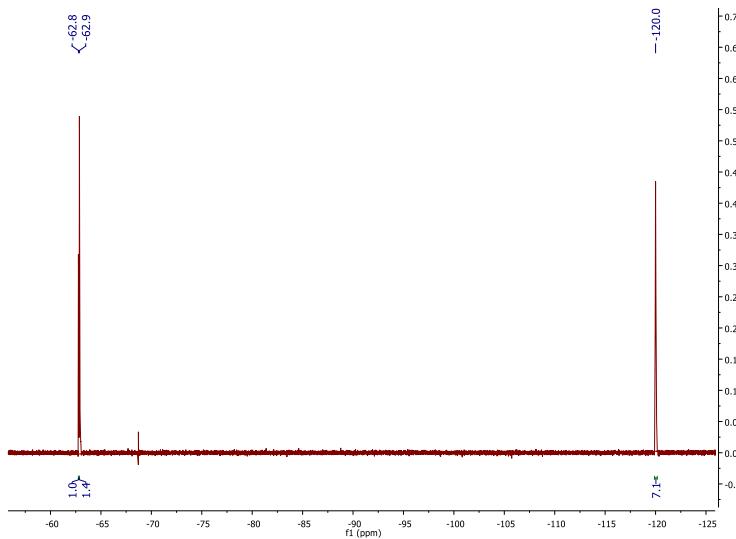

**Fig. S80**  $^{19}\text{F}$  NMR (400 MHz, DMF, 4-fluorotoluene as internal standard) of the hydrodehalogenation reaction of 4-bromobenzotrifluoride in the absence of *N*-Boc proline, and presence of **2** and  $\text{Cs}_2\text{CO}_3$  and 456-nm light irradiation for 24 h. The peaks at -62.8, -62.9 and -120.0 ppm correspond to  $\alpha,\alpha,\alpha$ -trifluorotoluene, 4-bromobenzotrifluoride and 4-fluorotoluene, respectively.

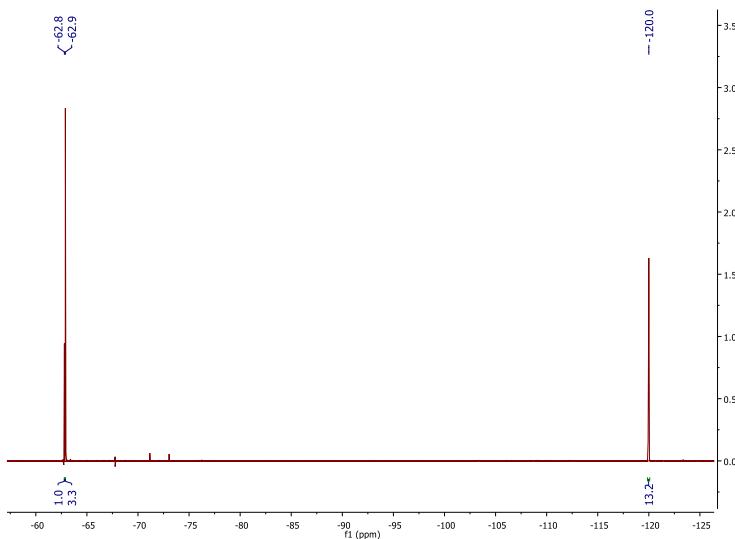

**Fig. S81**  $^{19}\text{F}$  NMR (400 MHz, DMF, 4-fluorotoluene as internal standard) of the hydrodehalogenation reaction of 4-bromobenzotrifluoride in the presence of **Ir-mod** ( $t_{\text{irra}} = 8$  h), *N*-Boc proline and  $\text{Cs}_2\text{CO}_3$  in the dark (entry 6, Table 4). The peaks at -62.90 and -120.00 ppm correspond to 4-bromobenzotrifluoride and 4-fluorotoluene, respectively.

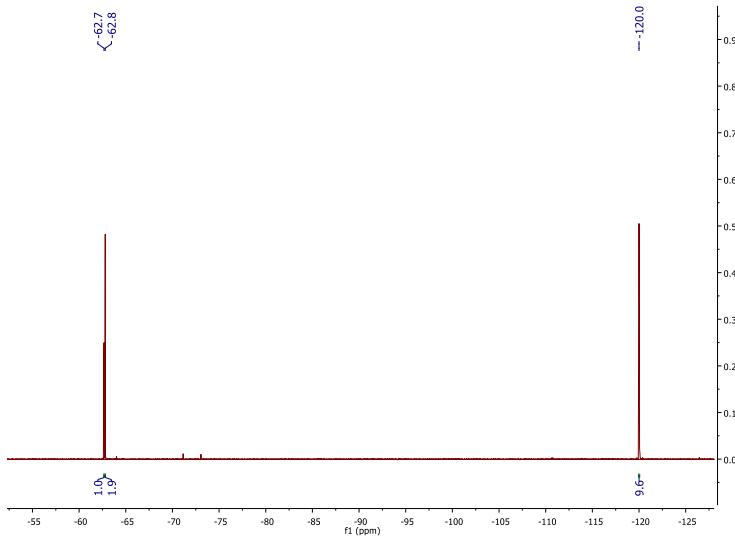

**Fig. S82**  ${}^{19}\text{F}$  NMR (400 MHz, DMF, 4-fluorotoluene as internal standard) of the hydrodehalogenation reaction of 4-bromobenzotrifluoride in the presence of **Ir-mod** ( $t_{\text{irra}} = 8$  h),  $\text{Cs}_2\text{CO}_3$  and 456-nm light irradiation for 24 h, and absence of *N*-Boc proline (entry 7, Table 4). The peaks at -62.8, -62.9 and -120.0 ppm correspond to  $\alpha,\alpha,\alpha$ -trifluorotoluene, 4-bromobenzotrifluoride and 4-fluorotoluene, respectively.

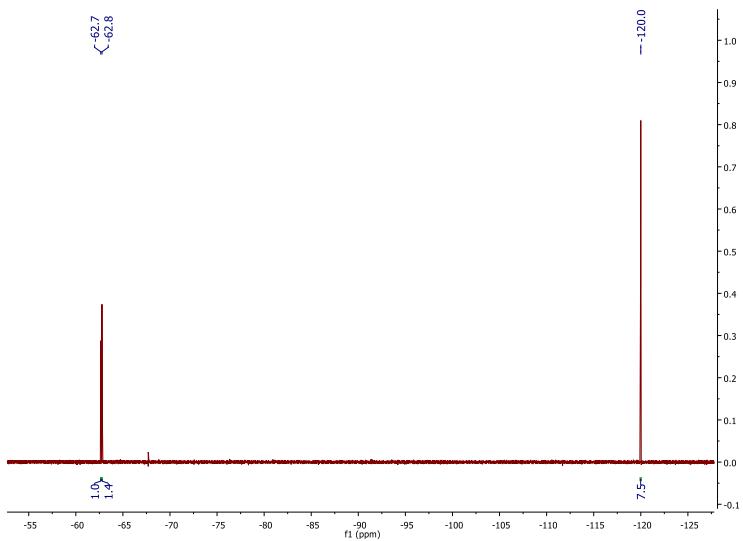

**Fig. S83**  ${}^{19}\text{F}$  NMR (400 MHz, DMF, 4-fluorotoluene as internal standard) of the hydrodehalogenation reaction of 4-bromobenzotrifluoride in the presence of **Ir-mod** ( $t_{\text{irra}} = 8$  h), DBU and 456-nm light irradiation for 24 h (entry 8, Table 4). The peaks at -62.8, -62.9 and -120.0 ppm correspond to  $\alpha,\alpha,\alpha$ -trifluorotoluene, 4-bromobenzotrifluoride and 4-fluorotoluene, respectively.

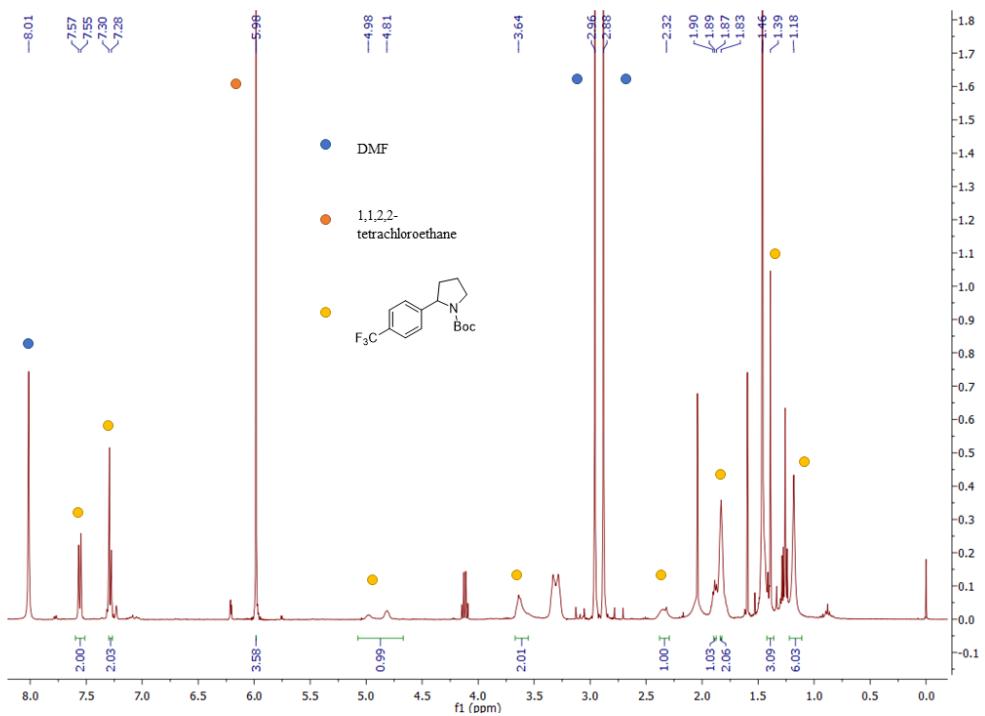

**Fig. S84**  $^{19}\text{F}$  NMR (400 MHz, DMF, 4-fluorotoluene as internal standard) of the hydrodehalogenation reaction of 4-bromobenzotrifluoride in the presence of **Ir-mod** ( $t_{\text{irra}} = 8$  h), TMG and 456-nm light irradiation for 24 h (entry 9, Table 4). The peaks at -62.8, -62.9 and -120.0 ppm correspond to  $\alpha,\alpha,\alpha$ -trifluorotoluene, 4-bromobenzotrifluoride and 4-fluorotoluene, respectively.

**Fig. S85**  $^{19}\text{F}$  NMR (400 MHz, DMF, 4-fluorotoluene as internal standard) of the hydrodehalogenation reaction of 2-chlorobenzotrifluoride (**6** in Table 5) in the presence of **1**, *N*-Boc proline,  $\text{Cs}_2\text{CO}_3$  and 456-nm light irradiation for 24 h. The peaks at -62.7, -62.8 and -120.0 ppm correspond to 2-chlorobenzotrifluoride,  $\alpha,\alpha,\alpha$ -trifluorotoluene and 4-fluorotoluene, respectively.

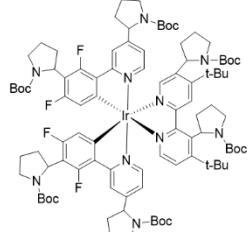

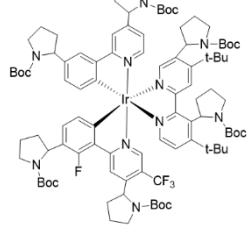

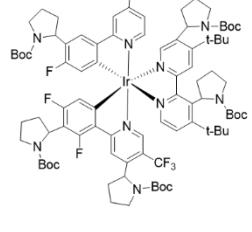

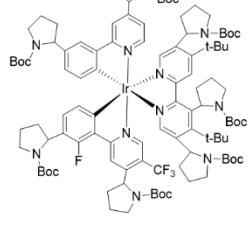

**Fig. S86**  $^{19}\text{F}$  NMR (400 MHz, DMF, 4-fluorotoluene as internal standard) of the hydrodehalogenation reaction of 2-chlorobenzotrifluoride 2-chlorobenzotrifluoride (**6** in Table 5) in the presence of **Ir-mod** ( $t_{\text{irra}} = 8$  h), *N*-Boc proline,  $\text{Cs}_2\text{CO}_3$  and 456-nm light irradiation for 24 h. The peaks at -62.7, -62.8 and -120.0 correspond to  $\alpha,\alpha,\alpha$ -trifluorotoluene, benzotrifluoride and 4-fluorotoluene, respectively.

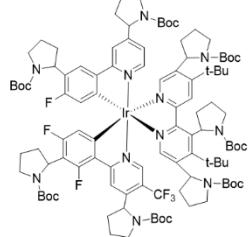

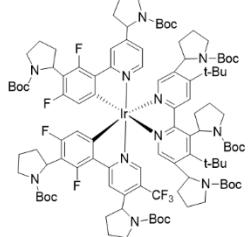

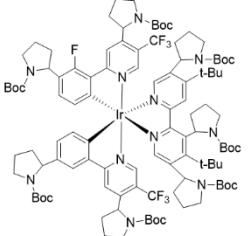

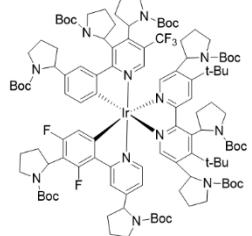

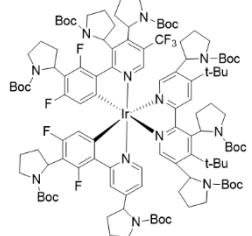

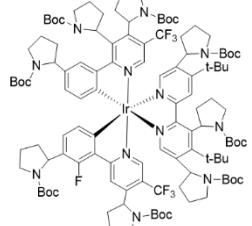

**Fig. S87**  $^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ , 1,1,2,2-tetrachloroethane as internal standard) of the reaction **Ir-mod/Ni** dual-catalyzed decarboxylative cross-coupling of *N*-Boc proline and 4-bromobenzotrifluoride. Assignments are labelled.

## S1. SUPPLEMENTARY TABLES

**Table S3** Isodensity surface plots of the LUMO (row 1) and HOMO (row 2 and 3), and HOMO-LUMO gap (row 4) for **1**, **2** and **3**.

<sup>a</sup>isodensity surface plot of the LUMO; <sup>b</sup>isodensity surface plot of the HOMO with a planar view of the phenyl ring of the modified C<sup>N</sup> ligand in **3** (in yellow box), and corresponding phenyl ring in **1** and **2** (in green box); <sup>c</sup>isodensity surface plot of the HOMO with a planar view of the phenyl ring of the unmodified C<sup>N</sup> ligand in **3** (in yellow box), and corresponding phenyl ring in **1** and **2** (in green box); <sup>d</sup>HOMO-LUMO gap (eV).

Density Functional Theory (DFT) calculations are performed on **1** and **2**. In addition, an Ir complex with a NBP attached onto one of the C<sup>N</sup> ligands with both F atoms removed is also examined (**3** in Fig. 1). Compound **3** is chosen as a model compound to demonstrate, *via* computational

chemistry calculation, the effect of NBP unit substituted on the cyclometallating ( $\text{C}^{\text{N}}$ ) ligand. **3** was not isolated experimentally but is instead used solely to understand through computational chemistry calculations the destabilisation of the HOMO upon addition of an electron-donating NBP and removal of electron-withdrawing fluorine atoms from the  $\text{C}^{\text{N}}$  ligand. In all the complexes studied, the LUMO is exclusively localized on the dtbbpy ligand (row 1, Table S3). On the other hand, for **1**, the HOMO is located on the metal center and phenyl rings of both dF( $\text{CF}_3$ )ppy ligands (row 2 and row 3, Table S3). The NBP on dtbbpy in **2** does not affect the arrangement of either the LUMO or HOMO.

The removal of fluorine atoms from and attachment of NBP substituents to the phenyl ring of a  $\text{C}^{\text{N}}$  ligand in **3** result in a positive inductive effect that causes the HOMO to be more spread out over the carbon atoms of the aromatic ring (row 2, Table S3). In particular, the lobe size around the carbon substituted with the NBP is significantly increased. Furthermore, the contribution of the unmodified dF( $\text{CF}_3$ )ppy ligand to the HOMO is decreased in **3** (row 3, Table S3). This is seen from the reduction in lobe size on the phenyl ring. Since the HOMO is dominated primarily by the transformed rather than intact  $\text{C}^{\text{N}}$  ligand, destabilization *via* NBP substitution and F atom elimination leads to a substantial rise in the HOMO energy relative to the energetically invariant LUMO in **3** (Fig. S9†), and the HOMO-LUMO energy gap decreases (row 4, Table S3).

**Table S4** Crystallographic data collection details for **2**.

The anisotropic atomic displacement factor exponent takes the form:  $-2\pi^2 [ h^2 a^{*2} U_{11} + \dots + 2 h k a^* b^* U_{12} ]$

**Table S19** Hydrogen atomic coordinates and isotropic atomic displacement parameters ( $\text{\AA}^2$ ) for **1**. Refer to Fig S4†.
