1 Supplementary Methods

1.1 Materials

Graphene (Timesnano company), lanthanum (III) chloride (99.5%, Tianjin Guangfu Chemical research institute), platinum (IV) tetrachloride (99%, Energy Chemical company), acetone (99.5%, Concord Tech reagent).

1.2 Experimental Methods

Experiments were performed on a 7.0 T FT ICR MS (Varian IonSpec) employing the commercial MALDI source in positive-ion mode. A 355nm Nd: YAG laser (Orion, New Wave) was used to create ions. Typical laser energy was set to be 85% relative to the maximum energy of 4mJ/pulse. Graphene was dispersed in water/acetone (9:1, vol/vol) at 1mg/ml. Lanthanum (III) chloride and platinum (IV) tetrachloride were dissolved in acetone at 5 mM and 1 mM, respectively. Then the solutions of LaCl₃ and PtCl₄ were mixed at the ratio of 1:1 (vol/vol). 1μL of graphene solutions was deposited on the stainless steel-plate and dried at room temperature, then 1μL of the mixture of LaCl₃/PtCl₄ was deposited on it. In the experiments, ions produced by six consecutive laser pulses were accumulated in the hexapole first. After the accumulation, the hexapole exit lens was gated so that ions could be transferred into the quadrupole guide. The DC potential of the trapping plate near the quadrupole was set to be 15 V before the introduction of the ions into the cell. During the period of ion transfer to the cell, the trapping plate was pulsed down to 0 V to allow the ions to enter the ICR cell. The ions were then cooled down by a pulsed nitrogen gas (with pressure in the cell raised to about 10⁻⁶ Torr) before detection or isolation for tandem MS. Typically, mass spectra were acquired in the *m/z* range of 700–2500.

1.3 Theoretical Methods

All DFT calculations were carried out using the Gaussian 09 program package.⁷⁷ In general, given a common +3 oxidation state of M (M = Sc, Y, Ln) in EMF of M₂@C_{2n} and M₃@C_{2n}^{53, 78}, the fullerene cage is in a valence state of -6. In this research, the valence state of platinum is difficult to be estimated at the first time, thus, all top negatively charged cages of C₉₈⁴⁻, C₉₈⁶⁻, C₉₈⁷⁻ and C₉₈⁸⁻ need to be considered. Therefore, 259 IPR-isomers of C₉₈ cages get from CAGE software⁷⁹ were first calculated with valences of -4, -6, -7 and -8 at the xTB level⁸⁰. These structures were then

ranked based on their energies, and the top 15 isomers of negatively charged cages C_{98}^{4-} , C_{98}^{6-} , C_{98}^{7-} and C_{98}^{8-} were chosen and optimized at the level of B3LYP/6-31g(d)^{81,82} (**Table. S1-S4**). It is worth noting that C_{98} empty cages calculated under different valence states (-6, -7, -8) have similar cage stability, so some of their respective top 15 most stable C_{98} cages (C_{98}^{6-} , C_{98}^{7-} and C_{98}^{8-}) are duplicates. Thus, the top five stable IPR isomers of C_{98}^{4-} , the top eight stable IPR isomers of C_{98}^{8-} and the top ten stable IPR isomers of C_{98}^{6-} , C_{98}^{7-} were all selected. Besides, the non-IPR cage of 168785 was also considered in this paper, due to its importance in $Gd_2@C_{98}$ isomers, as shown by Nagase. *et.al.*³¹ In total, the nine IPR isomers and one non-IPR isomer are selected here. Then, the La_3Pt metalloclusters were inserted into the optimized cages. For each cage, initial confirmations formed by insertions from more than 8 different directions were tried. All these isomers were optimized at the B3LYP/6-31g(d)/SDD level. The 6-31G(d) basis set is used for C atom, while SDD basis set is used for La and Pt atoms. Results show that for same carbon cage, there are several conformational isomers that are different in their orientations of the La_3Pt cluster relative to the cage. The results are shown in **Figures 2, S3** and **S4**. Their electronic energies were calculated with zero-point energy corrections. Two different DFT methods⁸³ of wB97X-D and TPSSH were applied to these isomers of $La_3Pt@C_{90}$, and the results are shown in **Table. S4**.

Relative concentrations (W_i) of the i -th isomer at different temperatures were calculated by:⁸⁴

$$W_i = \frac{q_i \exp(-\frac{DH_{0,i}^o}{RT})}{\sum_{j=1}^n q_j \exp(-\frac{DH_{0,j}^o}{RT})} \dots\dots\dots(1.1)$$

where R is the gas constant, T is the absolute temperature, q_i and $DH_{0,i}^o$ are the partition functions and the relative heat of formation at absolute zero temperature of the i -th isomer, respectively. And rotational-vibrational partition functions were calculated from the optimized structural and vibrational data obtained at the level of B3LYP/6-31g(d)/SDD without frequency scaling.

A series of wavefunction analyses were used to determine the bonding interactions and electronic properties of the $La_3Pt@C_{98}$ isomers using the Multifwn software.⁷² On one hand, the gaussian checkpoint files containing the wavefunction information were imported into Multifwn for ELF analysis, Mayer bonding order calculation, and interaction region indicator (IRI) analysis⁸⁵ to verify bonding interactions within these isomers. On the other hand, by combining Multifwn with Visual Molecular Dynamics (VMD)⁸⁶, it is feasible to plot the charge distribution maps, spin electron distribution maps, and molecular orbitals of $La_3Pt@C2(231010)-C_{98}$ and $La_3Pt@C1(231005)-C_{98}$, which can be used to better demonstrate the interesting electronic properties of EMFs. All of the wavefunction analyses presented above were carried out at the level of B3LYP /6-31g(d)/SDD. Herein, both spin electron distribution maps and molecular orbital diagrams are drawn in isosurface maps. The isovalue was set at 0.002.

To elucidate the bonding state, the local molecular orbitals (LMOs) were located using the popular

Pipek–Mezey localization method. The obtained LMOs were also verified by the adaptive natural density partitioning (adNDP) method.⁷³ The selection process is as follows: first, isolate the La₃Pt clusters; second, perform an orbital search in the order 1c-2e, 2c-2e, 3c-2e, 4c-2e; third, select the representative high occupation number of these orbitals (in each step, not all orbitals can be selected, otherwise, there will be no orbitals available for the next step). For a better rendering, the isovalue of all orbits was set at 0.5.

230839	2.51	2.51	2.50	2.51	3.37	acenaphthylene	acenaphthylene	acenaphthylene
168785	2.57	2.54	2.55	2.63	3.16	naphthalene	acenaphthylene	pentagon

- a. The La₁-C, La₂-C, La₃-C bond lengths are the distances between the three La atoms and their nearest C atoms in the cages of La₃Pt@C₉₈ isomers, and the La-C bond lengths are the average distances of the three values.
- b. The coordinated environment of La atoms has a series of types: pentagon (La atom coordinates with a pentagonal carbon ring of the cage); hexagon (La atom coordinates with a hexagonal carbon ring of the cage); naphthalene (La atom is located near the junctions of two hexagons); acenaphthylene (La atom is situated at the junctions of one pentagon and two hexagons); penalene (La atom is located near the junctions of three hexagons).

Table. S8 Comparison of La-La distances, La-Pt and La-C bond lengths (in Å) in the cages of La₃N@C_{88,92,96} and La₃Pt@C₉₈.

*

EMFs		La-La distances (in Å) ^a				La-Pt bond lengths (in Å) ^b				La-C bond lengths (in Å) ^c

a. The distances are La-La distances between La₁ (La₂, La₃) and La₂ (La₃, La₁) atoms, together with their average values;

b. The distances are La-Pt bond lengths between La₁ (La₂, La₃) and Pt atoms, together with their average values;

c. The La₁-C, La₂-C, La₃-C bond lengths are the distances between the three La atoms and their corresponding nearest C atoms in the cages. The La-C bond lengths are the average distances between the three La atoms and their nearest C atoms in the cages;

d. These La₃N@C_{2n} (2n=88, 92, 96) isomers were taken from the reference 33, 65, 66, in turn, and reoptimized at the level of B3LYP/6-31G(d).

*. A rough comparison shows that the distance between La-N is significantly shorter than the distance between La-Pt, while the distance between La-C (La₃N@C_{2n}) is slightly farer than the distance between La-C (La₃Pt@C_{2n}).

Table. S9 Relative energies and HOMO–LUMO gaps of different conformational isomers of La₃Pt@C₉₈ at the B3LYP/6-31g(d)/SDD level.

- a. Isomeric spiral ID is specific to each conformational isomer.
- b. Caged IPR-code is the IPR number specific to the cage of these $\text{La}_3\text{Pt}@C_{98}$ isomers. Different conformational isomers can share a common cage;
- c. The relative energy of each isomer with respect to that of the isomer 231010-1. Calculations were performed at the UB3LYP/6-31g(d)/SDD level. The order of energy ranking is shown in the first column, where the non-dominant conformational isomers are marked in red;
- d. HOMO-LUMO gap for α and β spin orbitals of $\text{La}_3\text{Pt}@C_{98}$ isomers at the UB3LYP/6-31g(d)/SDD level.

Table. S10 La-La distances (in Å) and La-Pt bond lengths (in Å), La-Pt-La bond angles (in degree) of the metal cluster La₃Pt in these conformational isomers of La₃Pt@C₉₈ at the B3LYP/6-31g(d)/SDD level.
