##### Materials and characterization methods

Organic reagents were purchased commercially and were used without further purification. 2-amino-4,4'-biphenyldicarboxylic acid ( $H_2L^1$ ) and 2,2'-diamino-4,4'-biphenyldicarboxylic acid ( $H_2L^2$ ) were synthesized according to the previously reported methods with slight modification (Scheme S1 and Fig. S1-S6).<sup>1-4</sup>  $^1H$  and  $^{13}C$  NMR were recorded on a Bruker Model AM-400 (400 MHz) spectrometer. Powder X-ray diffraction patterns were recorded with a Smartlab model X-ray diffractometer with Cu K $\alpha$  radiation ( $\lambda=1.5406 \text{ \AA}$ ). The morphology of samples was observed using a Hitachi SU8220 scanning electron microscope. Ultraviolet visible diffuse reflectance spectra were collected by a U-3010 spectrophotometer, barium sulfate ( $BaSO_4$ ) was used as the reference. Thermogravimetric analyses experiments were collected on TGA 500. The Brunauer-Emmett-Teller specific surface area measurements were conducted by a Micromeritics ASAP 2460 at 77K and the pore size distribution was calculated from the nonlocal density functional theory method. The Mott-Schottky plots, electrochemical

impedance spectroscopy and photocurrent tests were completed by using the CHI 760E. X-ray photoelectron spectroscopy was obtained with a Thermo Scientific K-Alpha XPS. Electron paramagnetic resonance spectra were measured on a Bruker Elexsys-II E500 spectrometer.

### **Synthesis of UiO-67-NH<sub>2</sub> and UiO-67-(NH<sub>2</sub>)<sub>2</sub>**

UiO-67-NH<sub>2</sub> and UiO-67-(NH<sub>2</sub>)<sub>2</sub> were synthesized by following the previously reported methods with slight modification.<sup>5</sup> Specifically, ZrCl<sub>4</sub> (60 mg, 0.26 mmol), H<sub>2</sub>L<sup>1</sup> (64.30 mg, 0.25 mmol) and benzoic acid (940 mg, 7.70 mmol) were dispersed in 10 mL of N, N-dimethylformamide (DMF), then the mixture was placed in a Teflon liner and sonicated for 10 minutes. After 24 h of reaction at 120 °C, the powder was collected and washed with DMF and acetone. Finally, the product was dried under vacuum. The preparation method of UiO-67-(NH<sub>2</sub>)<sub>2</sub> is similar to that of UiO-67-NH<sub>2</sub>, except that ligand H<sub>2</sub>L<sup>2</sup> is used instead of H<sub>2</sub>L<sup>1</sup>.

### **Photocatalytic H<sub>2</sub>O<sub>2</sub> production**

MOFs based Photocatalyst (5 mg) was suspended in deionized water (5 mL) and oxygen atmosphere was provided by an oxygen balloon. The dispersion liquid was stirred in the dark for 0.5 hour and then a blue LED (40 W) was used as the light source. The concentration of

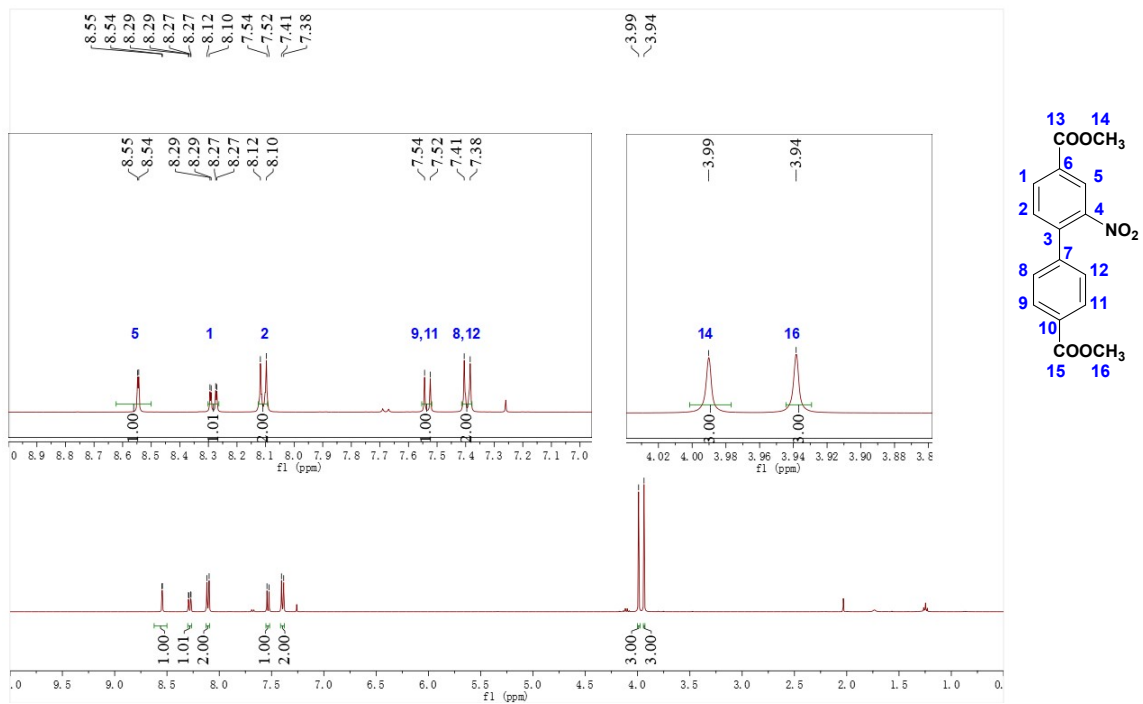

H<sub>2</sub>O<sub>2</sub> was measured by spectroscopic titration in an acidic solution of Ce(SO<sub>4</sub>)<sub>2</sub>.<sup>6</sup> To be specific, 2.5 mL of the reaction solution was centrifuged at 7500 rpm and then filtrated with a 0.22 μm filter to remove the photocatalyst. The sample was mixed with pre-prepared Ce(SO<sub>4</sub>)<sub>2</sub> solution (1 mM), and the yellow solution of Ce<sup>4+</sup> can be reduced by H<sub>2</sub>O<sub>2</sub> to produce colorless Ce<sup>3+</sup> (Eq. 1). The concentration of H<sub>2</sub>O<sub>2</sub> could be calculated from the change of Ce<sup>4+</sup> concentration (Eq. 2).

To get the calibration curve, Ce(SO<sub>4</sub>)<sub>2</sub> of different mass was dissolved in 0.5 M H<sub>2</sub>SO<sub>4</sub> and the absorption intensity was measured by UV-vis spectrometer (Fig. S7a). The linear relationship between absorption intensity and Ce<sup>4+</sup> concentration can be found in Fig. S7b). The absorption peak used for the measurement is 316 nm.

$$c(\text{H}_2\text{O}_2) = 1/2 \times c(\text{Ce}^{4+}) \quad (2)$$
