27 determine the carbohydrate.

28

### 29 **Moisture Analysis**

30 The moisture content of the samples was determined using the Sartorius MA35  
31 model, a moisture analyzer, in accordance with the procedure outlined in AOAC  
32 (Association of Official Analytical Chemists, 2005)<sup>1</sup>. Each sample weighing 2 grams  
33 was carefully placed in the moisture analyzer. The analysis was conducted for a  
34 duration of 1 hour to ensure accurate measurement of the moisture content.  
35 Subsequently, an additional 10 minutes run was performed to verify the consistency  
36 of the weight difference among the samples, with the aim of keeping the variance  
37 within an acceptable range of less than 1 mg. This additional step was implemented  
38 to ensure the reliability and consistency of the moisture content measurement. The  
39 methodology prescribed in AOAC (2005) provides standardized guidelines for  
40 moisture analysis in various food and agricultural products.

41

### 42 **Sensory evaluation**

43 The quality of the vegan meat alternative study was assessed through sensory  
44 evaluation. The evaluation focused on several sensory parameters, including taste,  
45 texture, odor, appearance, and overall acceptability. A panel of 10 trained evaluators  
46 (6 male and 4 females, aged between 19 and 30, non-smokers) participated in the  
47 assessment. The sensory evaluation was conducted using a 9-point hedonic scale,  
48 where the evaluators rated each attribute on a scale ranging from 1 (dislike  
49 extremely) to 9 (like extremely). This scale allowed for subjective evaluation of the  
50 sensory attributes, providing insights into the evaluators' preferences and

51 perceptions of the vegan meat alternative. To determine the overall acceptability of  
52 the product, the average scores from all the sensory attributes were considered. This  
53 involved combining the individual scores for taste, texture, odor, appearance, and  
54 overall acceptability to calculate an overall score that reflected the evaluators' overall  
55 perception and acceptance of the product. By utilizing sensory evaluation and  
56 hedonic scales, valuable information regarding the sensory characteristics and  
57 consumer acceptance of the vegan meat alternative was obtained. Considering  
58 multiple sensory attributes and overall acceptability allows researchers to assess the  
59 overall quality and potential market acceptance of the product<sup>2</sup>.
