Determination of fluorescence Quantum Yields (Φ) of CBTA and its complex with CN⁻

The luminescence quantum yield was determined using coumarin-153 as reference dye. The compounds and the reference dye were excited at the similar wavelength and the emission spectra were then studied. The area of the emission spectrum was integrated and the quantum yield is determined according to the following equation:

$$\phi_S/\phi_R = [A_S/A_R] \times [(Abs)_R / (Abs)_S] \times [n_S^2/n_R^2]$$

Here, ϕ_S and ϕ_R are the luminescence quantum yields of the sample and reference dye, respectively. A_S and A_R are the area under the emission spectra of the sample and the reference respectively, $(Abs)_S$ and $(Abs)_R$ are the respective optical densities of the sample and the reference solution at the wavelength of excitation, and n_S and n_R stand for the values of refractive index for the respective solvent used for the sample and reference.

The quantum yields of CBTA and CBTA-CN are determined using the above mentioned equation and the values are found to be 0.205 and 0.015 respectively.

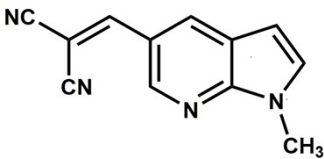

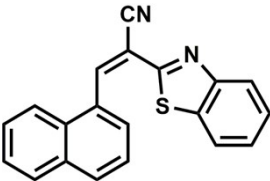

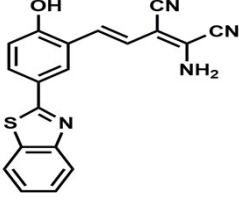

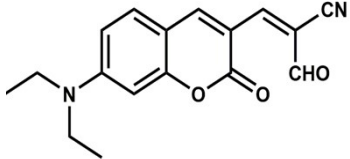

Table S2: Fluorescence lifetime data

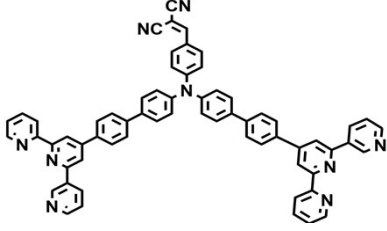

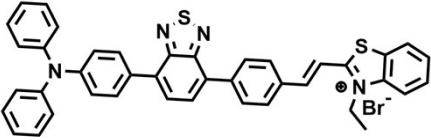

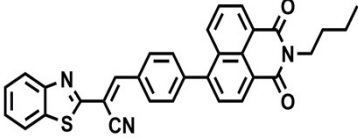

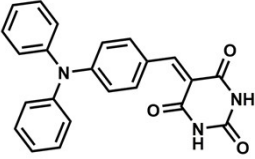

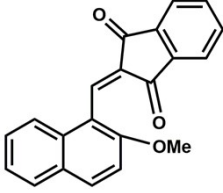

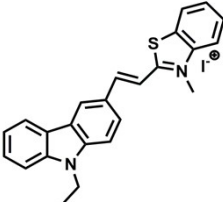

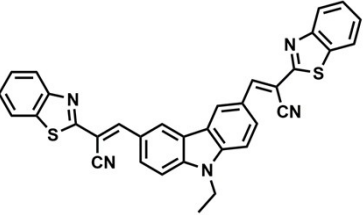

DMSO(Solvent)	Quantum yield(ϕ)	τ (ns)	$K_r(10^8 \times S^{-1})$	$K_{nr}(10^8 \times S^{-1})$
CBTA	0.205	6.1	0.336	1.303
CBTA-CN⁻	0.015	1.38	0.1086	7.137
