## General Information

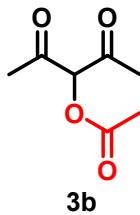

All reagents were purchased from Sigma-Aldrich and used without previous purification. The NMR spectra were recorded using a JEOL ECA-500 spectrometer with a magnetic field of 11.75 T ( $^1\text{H}$ , 500.160 MHz;  $^{13}\text{C}$ , 125.765 MHz). The unified scale was used with TMS as reference diluted (volume fraction  $\varphi < 1\%$ ) in chloroform for  $^1\text{H}$  resonance (( $\text{CH}_3$ )<sub>4</sub>Si  $^1\text{H}$ ,  $^{13}\text{C}$  = 0).<sup>1</sup> The UV/Vis absorption spectra were recorded with a Perkin Elmer Lambda 2S UV-VIS spectrophotometer. Low resolution mass spectra were acquired with HPLC/coupled mass Agilent Technologies (ESI).

## Synthesis of $\alpha$ -acetoxyketones

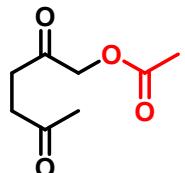

**General procedure:** In a flask, 1 equivalent of the corresponding ketone and 2.5 equivalents of  $\text{PhI}(\text{OAc})_2$  were dissolved in the appropriate solvent, and 10 equivalents of acetic acid were added. The reaction mixture was stirred for 3 days at 70°C. The solvent was evaporated, and the samples were purified by column chromatography using silica gel (60 Å, 200-240 mesh) and hexane/ethyl acetate 8:2 as the eluent.

The yield % is in parenthesis and the selectivity ratio in brackets. b) Conversion calculated in the mixture. c) Direct determination from the crude reaction in order to prevent the loss due to the evaporation of the solvent.

## Cross-over acid experiment

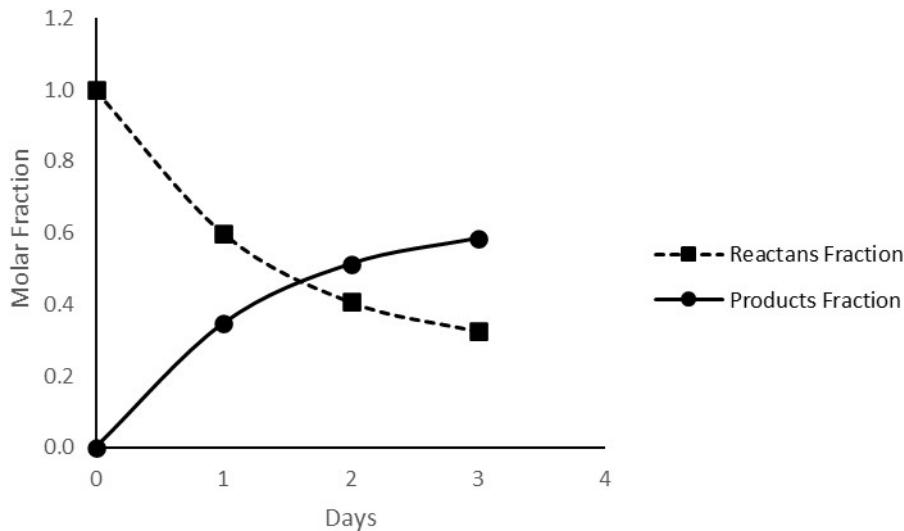

**General procedure:** In a round-bottom flask, 0.17 mL (1.46 mmol) of acetophenone, 0.96 g (2.98 mmol) of PhI(OAc)<sub>2</sub>, and the corresponding equivalents of *p*-TsOH monohydrate and acetic acid were added in 3mL of acetonitrile. **Procedure:** In a round-bottom flask, 0.17 mL (1.46 mmol) of acetophenone and 0.72 g (2.24 mmol) of PhI(OAc)<sub>2</sub> were dissolved in 3mL of acetonitrile, and 0.85mL (14.85 mmol) of acetic acid were added. The reaction mixture was stirred and monitored for 3 d at 70°C; each aliquot was taken per day. For the analysis of the aliquots, the solvent was removed under vacuum and the crude reaction mixture was analyzed by <sup>1</sup>H NMR.

## Computational details

The optimization of the geometries and calculation of the frequencies were carried using functional  $\omega$ B97X-D<sup>23</sup> with the basis set Def2TZVP<sup>24</sup> for C, H and O, and LANL2DZ for iodine atoms, with effective core potential and the addition of polarization (P) and diffuse (D) functions.<sup>25,26</sup> The addition of P and D functions to the LANL2DZ leads to geometries closer to those obtained by experimental methods as described previously by Cerioni and coworkers.<sup>27</sup> The free energy data was obtained with thermal correction in the frequency calculations. The NBO analysis was carried out with the basis set AUG-cc-pVTZ for C, H, and O atoms and AUG-cc-pVDZ-PP for I with effective core potential as described by Peterson.<sup>28</sup> The basis sets were obtained from Basis Set Exchange data base.<sup>29</sup> The NBO analysis included a solvation model (SMD) on acetonitrile. All the calculations were carried out using the Gaussian 09 suite.<sup>30</sup>
