1. General experimental details

All air- and moisture-sensitive reactions were carried out under an atmosphere of argon, magnetically stirred, and monitored by thin layer chromatography (TLC). IPrCl-Cl was prepared as described.¹ Unless otherwise noted, all reagents were obtained from commercial suppliers and used without further purification. The NHC precursors were dried under vacuum before use. NMR spectra were recorded on either Bruker 300 spectrometer operating at 300 MHz and 75 MHz for ¹H acquisition and ¹³C acquisitions. Chemical shifts were referenced to the residual proton solvent peak (¹H: CDCl₃, δ 7.26; (CD₃)₂SO, δ 2.49), solvent ¹³C signals (CDCl₃, δ 77.16; (CD₃)₂SO, δ 39.52). Signals are listed in ppm, and multiplicity identified as s=singlet, br=broad, d=doublet, t=triplet, q=quartet, m=multiplet; coupling constant in Hz. High resolution mass spectra were obtained using Bruker MALDI-TOF-MS.

2. General procedure for the Synthesis of Ynones (3aa-3f'a)

A mixture of carboxylic acids (0.40 mmol), phenylacetylene (0.20 mmol), IPrCl-Cl (0.44 mmol), CuI (5 mol%) and Pd(PPh₃)₂Cl₂ (2 mol%) in Et₃N (3 mL) was stirred at 90 °C under argon atmosphere for 3 h. The reaction was quenched by water and extracted with dichloromethane. The combined organic extracts were dried over Na₂SO₄, concentrated in vacuum. The resulting residue was purified by silica gel column chromatography to afford the desired products.

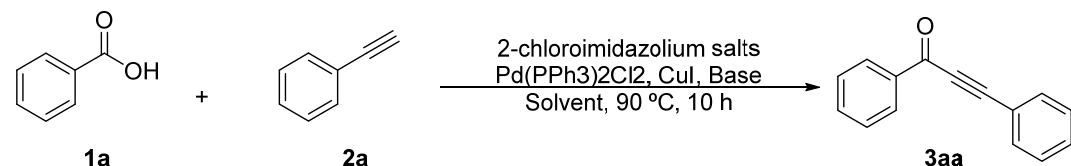

3. General procedure for the Synthesis of Ynones (3ab-3ao)

A mixture of benzoic acid (0.40 mmol), alkynes (0.20 mmol), IPrCl-Cl (0.44 mmol), CuI (5 mol%) and Pd(PPh₃)₂Cl₂ (2 mol%) in Et₃N (3 mL) was stirred at 90 °C under argon atmosphere for 3 h. The reaction was quenched by water and extracted with dichloromethane. The combined organic extracts were dried over Na₂SO₄,

concentrated in vacuum. The resulting residue was purified by silica gel column chromatography to afford the desired products.
