## Additional Experimental Details

**Crystallization of additional solvates of 1.** One equivalent of CdCl<sub>2</sub> (50 mM in MeOH, 10 mL, 50 mmol) was added dropwise to a stirred solution containing 2.5 mL MeOH, NaOH (0.2 M in MeOH, 2.5 mL, 50 mmol) and LH (0.1 M in MeOH, 5.0 mL, 50 mmol). Transient cloudiness occurred during the addition. The solution was divided into 1 mL aliquots. Various cosolvents (0.2, 0.5 and 1.0 mL) were mixed with each aliquot before setting aside for slow evaporation. After three weeks, diffraction quality crystals were obtained in low yield of **1**·m-xylene with m-xylene as cosolvent and of **1**·MeOH with ethyl acetate as the cosolvent. Both crystals became opaque when vacuum dried.

**Single Crystal Diffraction of additional solvates of 1.** Single crystal diffraction data for additional solvates were collected using graphite-monochromated Mo K $\alpha$  X-radiation ( $\lambda = 0.71073$  Å) on a Bruker D8 Venture Photon 3. The structures were solved by intrinsic phasing and refined on  $F^2$  by full-matrix least squares using the ShelXle 2019/3 program package.<sup>1</sup> All non-hydrogen atoms were refined anisotropically and the hydrogens were placed theoretically. Crystallographic data for **1**·m-xylene and **1**·MeOH are provided in Table S1. Selected bond distances and angles are provided in Table S2.

### Brief overview of the structures of additional solvates of 1

The neutral dinuclear complex [CdLCl]<sub>2</sub>·m-xylene (**1**·m-xylene) crystallized in the triclinic space group  $P-1$  with one dimeric complex and one disordered m-xylene molecule per unit cell. Both the complex and the m-xylene molecule lie on crystallographic inversion centers. Although not isomorphic, bond distances and bond angles for **1** are comparable in the m-xylene (Table S2) and benzene (Table 4) solvates. The distorted envelope ring conformations have matching flap positions.

The neutral dinuclear complex [CdLCl]<sub>2</sub>·MeOH (**1**·MeOH) crystallized in the monoclinic space group  $C2/c$  with one dimeric complex and one disordered methanol molecule per unit cell. The complex lies on a crystallographic inversion center and the methanol lies on a  $C_2$  axis. Bond distances and bond angles for **1**·MeOH (Table S2) are comparable to the other two solvates of **1**. The distorted envelope ring conformations also have matching flap positions.

**Table S1.** Crystallographic data for additional [CdLCl]<sub>2</sub> solvates.

Solvate	m-xylene	MeOH
Empirical Formula	C <sub>36</sub> H <sub>42</sub> Cd <sub>2</sub> Cl <sub>2</sub> N <sub>6</sub> S <sub>2</sub>	C <sub>29</sub> H <sub>36</sub> Cd <sub>2</sub> Cl <sub>2</sub> N <sub>6</sub> OS <sub>2</sub>

m-xylene solvate symmetry code: #1:  $-x + 2, -y + 1, -z + 1$ ; methanol solvate symmetry code:  
#1:  $-x + 3/2, -y + 1/2, -z + 1$

**Figure S1.** Stacking diagram of **1** along  $b^*$  showing formation of sheets through pairwise N1A pyridyl (5.198 Å centroid–centroid separation; 3.526 Å normal separation) and N1B pyridyl (3.963 Å centroid–centroid separation; 3.297 Å normal separation) offset face-to-face interactions<sup>2</sup> or C–H  $\pi$  attractions.<sup>3</sup> Benzene molecules are located between sheets and potentially involved in a weak multimolecular embrace with four neighboring N1A pyridyl rings.<sup>4</sup> Hydrogen atoms omitted for clarity.

**Figure S2.** Stacking diagram of **2** along *b* showing formation of strands along the *a* direction through pairwise N1B (3.598 Å centroid–centroid separation; 3.349 Å normal separation) and N1A (4.385 Å centroid–centroid separation; 3.884 Å normal separation) pyridyl ring OFF interactions as well as EF interactions between N1A and N1B pyridyl rings (4.811 Å centroid–centroid separation; 4.391 Å normal separation).<sup>2,5</sup> The chains are networked with their neighbors through a zig-zag aryl embrace between N1A pyridyl rings (5.554 Å centroid–centroid separation; 5.183 Å normal separation).<sup>4</sup> Hydrogen atoms omitted for clarity. OFF in violet; EF in red; aryl embrace EF interactions in light blue.

**Figure S3.** Intermolecular aromatic distances (Å) between pyridyl rings, identified by their nitrogen atoms, in **3** (CDC Refcode XALTEJ) <sup>6</sup>. Hydrogen atoms are omitted for clarity. OFF in violet; EF in red.

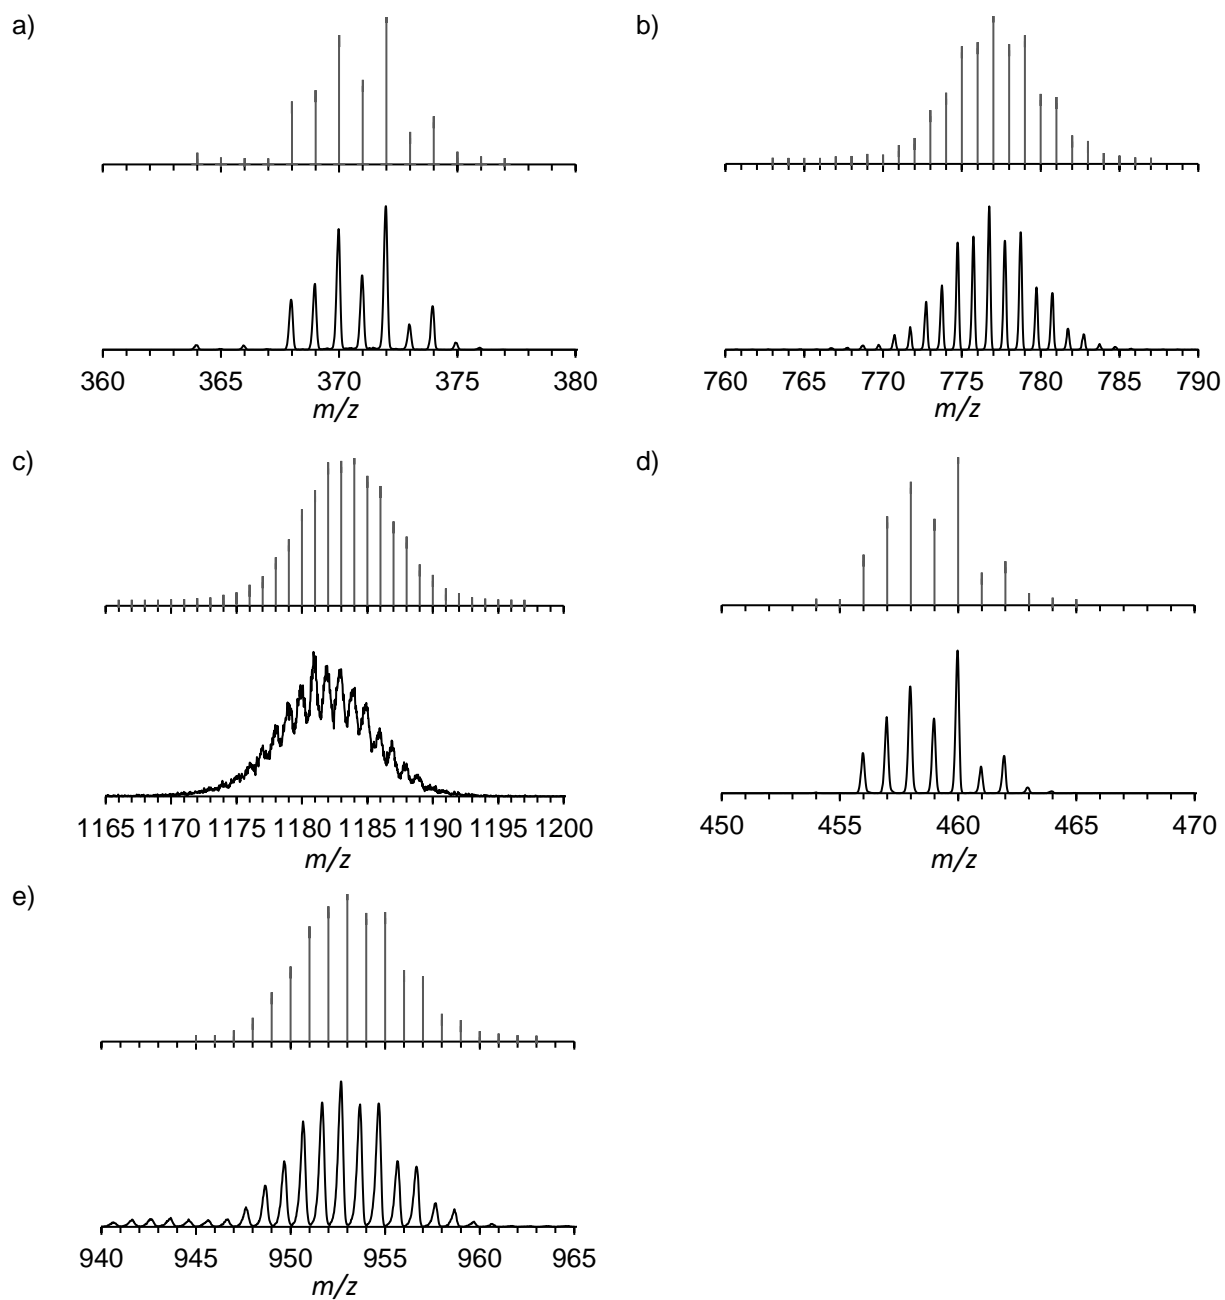

**Figure S4.** Overlay of  $H_a$  resonances for **2** ( $CD_3CN$ ; nominally 5 mM) at 60 °C (dashed black) and -40 °C (solid orange) accentuating the partially resolved  $J(^{199}Hg^1H)$  coupling satellites.

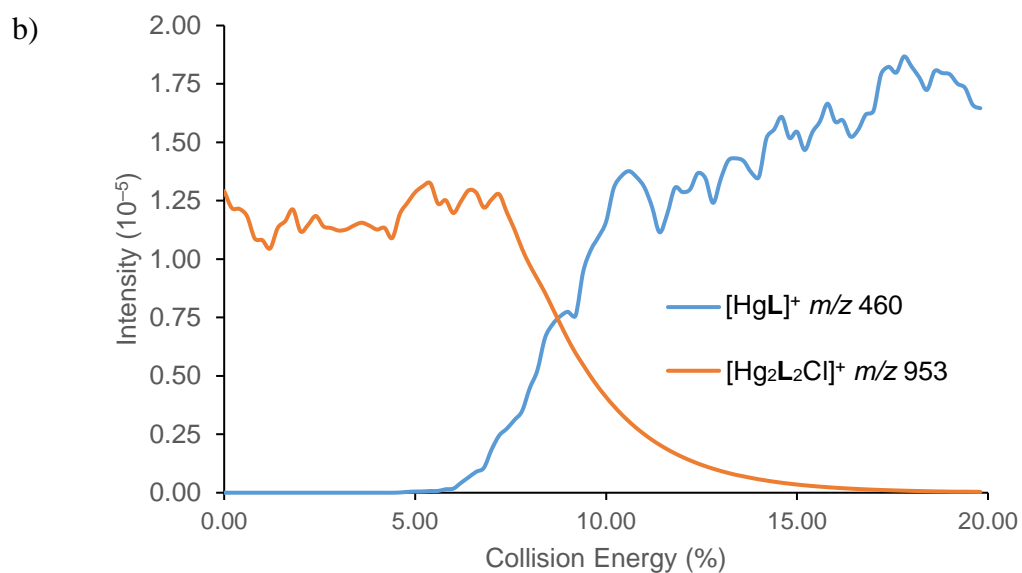

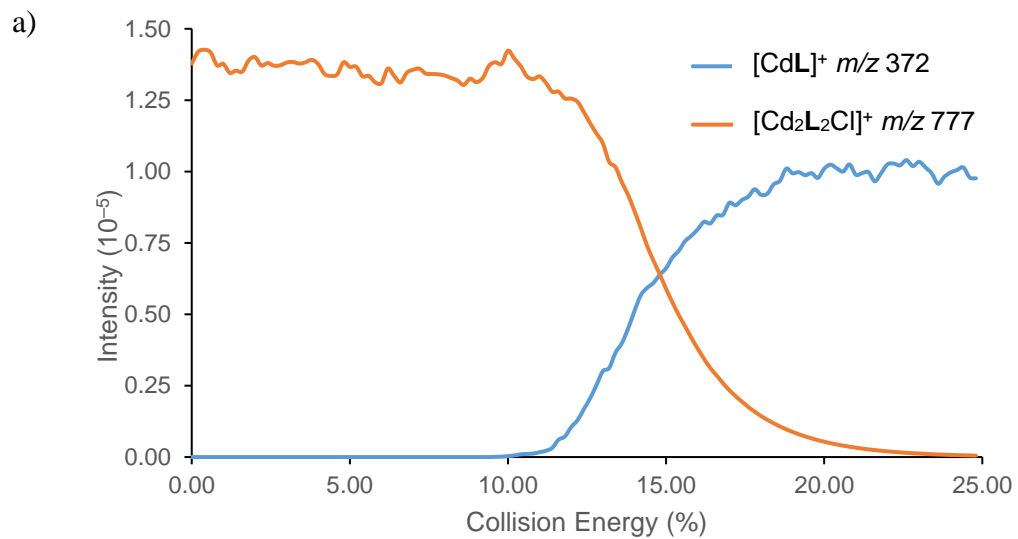

**Figure S5.** Ethylene proton NMR highlights of **2** ( $CD_3CN$ , nominally 5 mM) as a function of temperature. Resonances assigned to a minor environment in slow exchange on the chemical shift time scale at low temperature are labeled with primes.

**Figure S6.** Calculated isotope pattern (top) and observed positive ion direct infusion ESI-MS ZoomScan isotope pattern (bottom) of (a)  $[\text{CdL}]^+$ , (b)  $[\text{Cd}_2\text{L}_2\text{Cl}]^+$ , (c)  $[\text{Cd}_3\text{L}_3\text{Cl}_2]^+$ , (d)  $[\text{HgL}]^+$  and (e)  $[\text{Hg}_2\text{L}_2\text{Cl}]^+$ .

**Figure S67** Collision energy plots following the intensity of the most abundant isotopomers for a) [CdL]<sup>+</sup> and [Cd<sub>2</sub>L<sub>2</sub>Cl]<sup>+</sup> and b) [HgL]<sup>+</sup> and [Hg<sub>2</sub>L<sub>2</sub>Cl]<sup>+</sup>.
