**Figure S1:** Configuration assignment of compound **17a** by comparison of the  $^1\text{H}$  anomeric resonances.

## STABILITY STUDIES

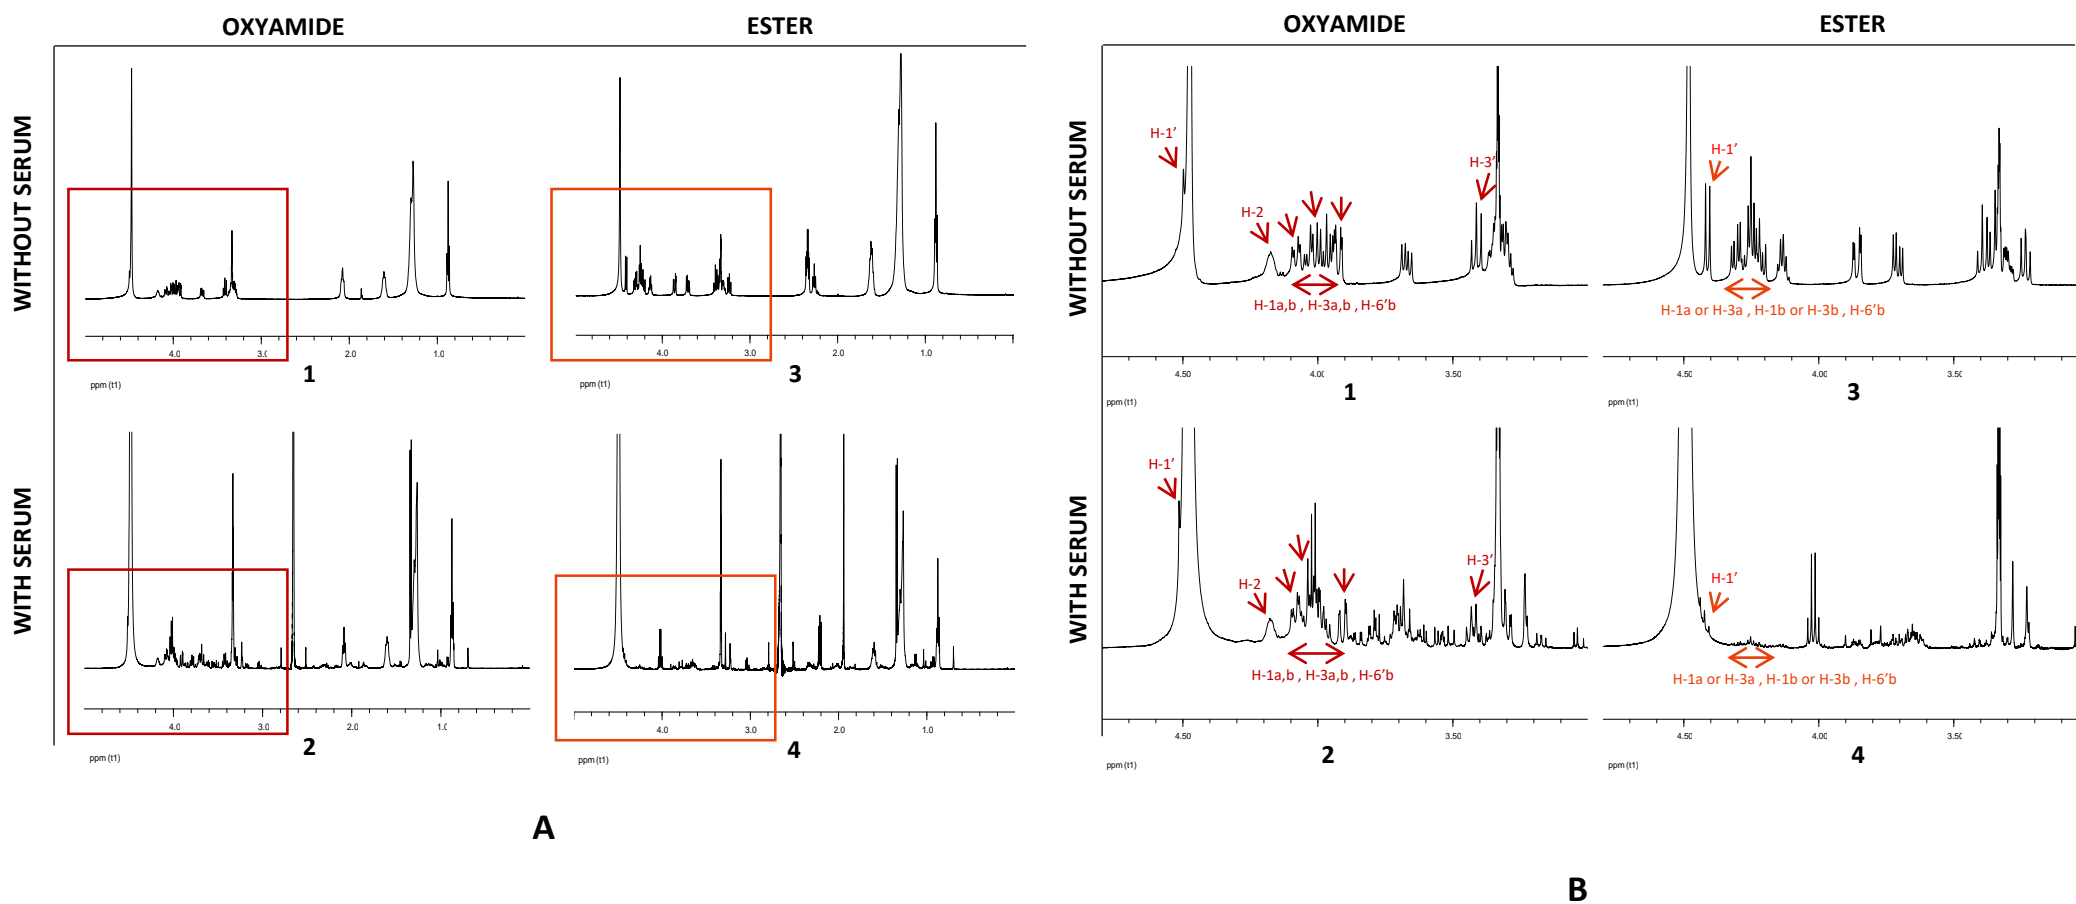

**A**

**B**

**Figure S2: A.** TLC at 16 h of compound **3b** (left) and **5** (right), DCM:MeOH (85:15). In each TLC the pure compound is seeded on the left while on the right after incubation with serum, in the centre the superimposition of both. **B.** TLC at 24 h of compound **3b** (left) and **5** (right), DCM:MeOH (85:15). In each TLC the pure compound is seeded on the left while on the right after incubation with serum; in the centre the superimposition of both.

# STABILITY STUDIES

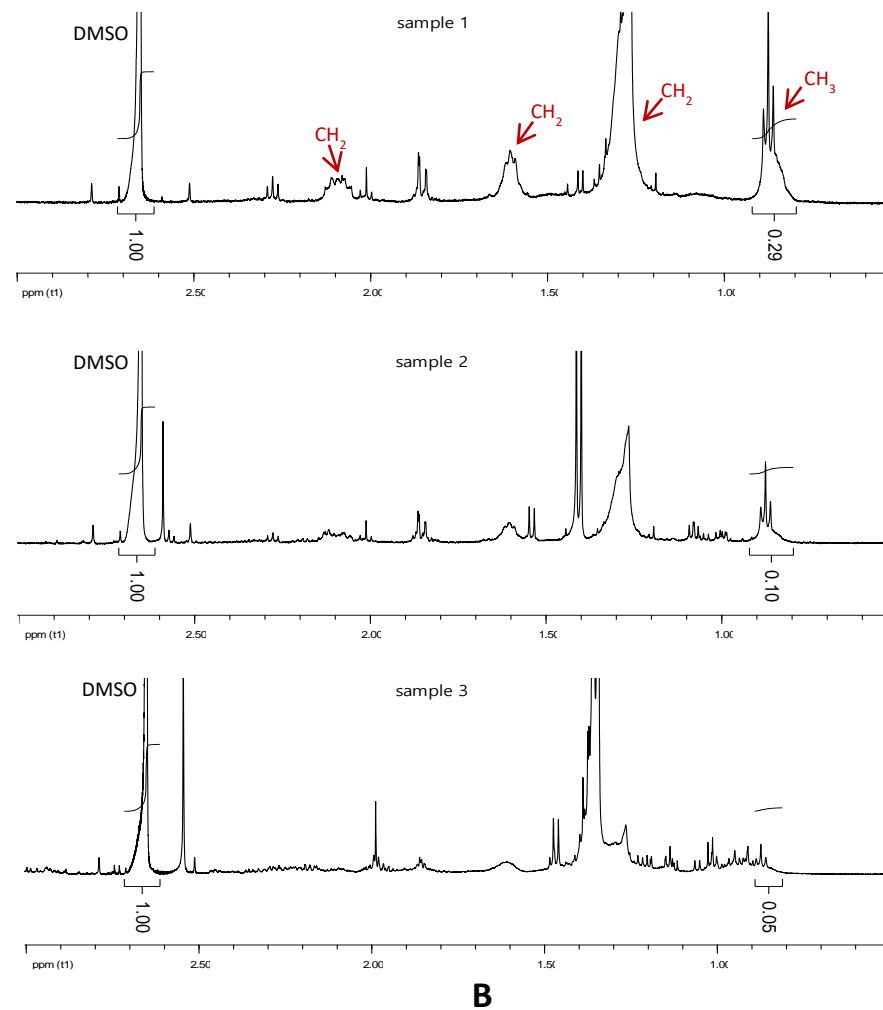

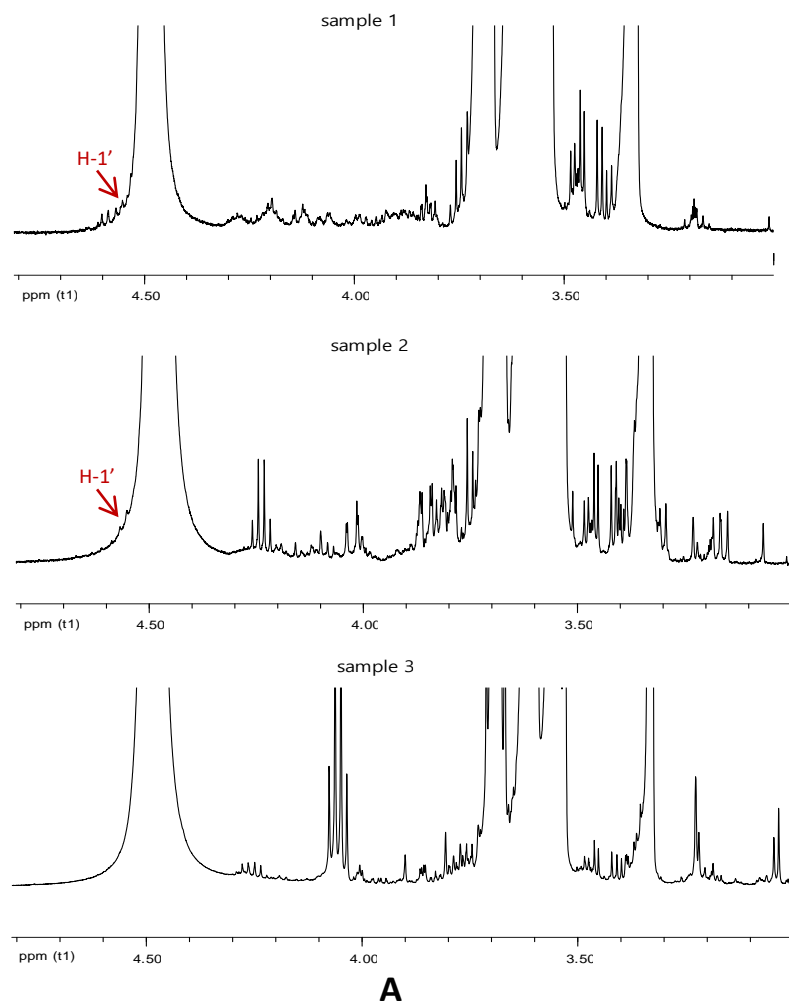

**Figure S3:**  $^1\text{H}$  NMR spectra of compound **3b** (A-1), compound **3b** after incubation with serum (A-2), compound **5** (A-3), compound **5** after incubation with serum (A-4). B-1/B-4: 3.0-4.8 ppm window of the corresponding  $^1\text{H}$  NMR spectra A-1/A-4. The arrows highlighting characteristic signals of the compounds recognisable in the NMR spectra after incubation.

## SERUM BINDING STUDY on compound 3a

**Figure S4:** comparison of the <sup>1</sup>H NMR spectra of sample 1, 2 and 3 (0%, 10%, 60% serum concentration respectively). Glycerol appears as an impurity from the Amicon® Ultra-0.5 30K centrifugal filter device at 3.53-3.70 ppm. DMSO (2.65 ppm) is used as an internal standard.

## SERUM BINDING STUDY on compound 3a

**Figure S5: A.** 3.0-4.8 ppm window of the <sup>1</sup>H NMR spectra of sample 1, 2, and 3 (0%, 10%, 60% serum concentration respectively): the arrows indicate the H-1' of the glucose moiety. **B.** 0-3 ppm window of the <sup>1</sup>H NMR spectra of sample 1, 2 and 3: integrals of signals at 2.65 ppm (DMSO, internal standard) and 0.863 ppm (CH<sub>3</sub> of the acyl chains) are shown. Their comparison shows the diminishing of non-bound **3a** with the increase of serum amount. The arrows indicate characteristic resonances of compound **3a**.
