2i	515	22900	710	196	5371	0.2 ^[d]

^[a] Absorption maxima of solutions with concentration of 3×10^{-5} M

^[b] Emission maxima of solutions with concentration of 3×10^{-5} M (absorption maxima were used for excitation)

^[c] The relative emission quantum yield (Φ_{em}) was measured using 7-hydroxy-4-methylcoumarin in phosphate buffer with pH 10 (Φ_{em} 0.7) using 330 nm as excitation wavelength

^[d] The relative emission quantum yield (Φ_{em}) was measured using Rhodamine 6G in ethanol (Φ_{em} 0.95) using 450 nm as excitation wavelength.

3. Calculation of charge-transfer properties of compounds **2c** and **2i**

The change in the dipole moment $\Delta\mu$ (in Debyes) upon transition between the ground and excited states for compounds **2c** and **2i** was estimated using the Lippert–Mataga equation:

$$\Delta\nu = \nu_{abs} - \nu_{em} = f(\varepsilon_r, n) \frac{2(\Delta\mu)^2}{hc a^3} + const$$

where $\Delta\nu$ is the Stokes shift value found as the difference between absorption (ν_{abs}) and emission (ν_{em}) maxima wavenumbers (in cm^{-1}) in corresponding solvent; h is Planck's constant (6.6262×10^{-27} erg \times s); c is the speed of light in vacuum (2.9979×10^{10} cm/s); a is the cavity radius (in Å) in which the solute resides estimated from the van der Waals volume ($V_{VDW} = \frac{4}{3}\pi a^3$) of the fluorophore molecule; $f(\varepsilon_r, n)$ is the orientation polarizability (Lippert-Mataga polarity function) of the solvent defined as:

$$f(\varepsilon_r, n) = \frac{\varepsilon_r - 1}{2\varepsilon_r + 1} - \frac{n^2 - 1}{n^2 + 1}$$

where ε_r is the static dielectric constant and n is the optical refractivity index of the solvent (Table S4).

The van der Waals volumes (V_{VDW}) of molecule **2c** and **2i** were calculated by the following reported formula^[1]:

$$V_{VDW} = \sum (\text{all atom contributions}) - 5.92N_B - 14.7R_A - 3.8R_{NA}$$

where $N_B = (\text{Number of atoms} - 1 + R_A + R_{NA})$; R_A is the number of aromatic rings; R_{NA} is the number of non-aromatic rings; and V_{vdw} for C = 20.58 Å³; for H = 7.24 Å³; for O = 14.71 Å³; for N = 15.60 Å³; for Cl = 22.45 Å³

Table S3. Calculated Van Der Waals Volume (V_{VDW}) and cavity radius (a).

Dye	Molecular Formula	$\sum(\text{all atom contributions})$	N_B	Vvdw (Å ³)	a (Å)
2c	C ₁₇ H ₁₂ ClN ₃ O	520.7	35	284.1	4.1
2i	C ₁₈ H ₁₅ ClN ₄	563.8	39	303.6	4.2
