**05 December 2023 - Note added after first publication:** This Supplementary Information file replaces that originally published on 20 October 2023. The spectra for compounds 4a-4z, 4aa-4ac, 5 and 7a-7b have been updated with the correct data.

## 1. General remarks

Unless otherwise noted, the commercially available reagents were used directly without further purification. All reactions were performed under nitrogen gas atmosphere. Anhydrous solvents were directly purchased from Energy Chemical and stored under nitrogen gas. Thin layer chromatography (TLC) was performed using Huanghai TLC silica gel plates HSGF254 and visualized using UV light or potassium permanganate ( $\text{KMnO}_4$ ). Flash column chromatography was performed using 200-300 mesh silica gel. The  $^1\text{H}$  NMR,  $^{13}\text{C}$  NMR and  $^{19}\text{F}$  NMR spectra were recorded on a Bruker AV-400 MHz with  $\text{CDCl}_3$  (7.26 ppm for  $^1\text{H}$  NMR, 77.0 ppm for  $^{13}\text{C}$  NMR) as solvent. Data are reported as follows: chemical shift  $\delta/\text{ppm}$ , integration ( $^1\text{H}$  only), multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet or combinations thereof;  $^{13}\text{C}$  signals are singlets unless otherwise stated), coupling constants  $J$  in Hz, assignment. High Resolution Mass Spectrometry (HRMS) were recorded on HPLC-Q-TOF mass spectrometer. The measured HRMS values are reported to 4 decimal places of the calculated value. The UV-Vis data were obtained from HP 8453 spectrometer.

## 2. Photochemical reaction setup

Household blue LED strips (30 W, 400-410 nm) were coiled around the inside of an aluminium ware with 15 cm diameter (Figure S1, left). The maximum emission of the LED strips at 405 nm (Figure S1, right). The Quartz glass was used as reaction vessel at room temperature.

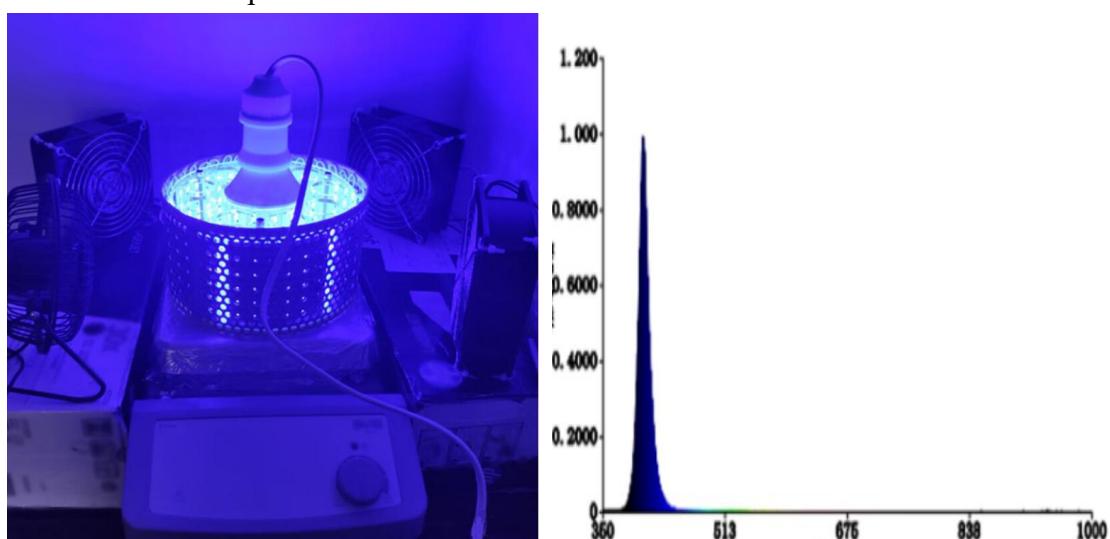

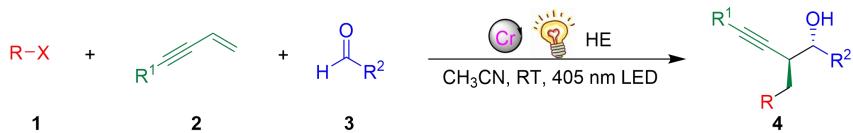

Figure S1. Reaction setup (left) and the emission spectra (right)

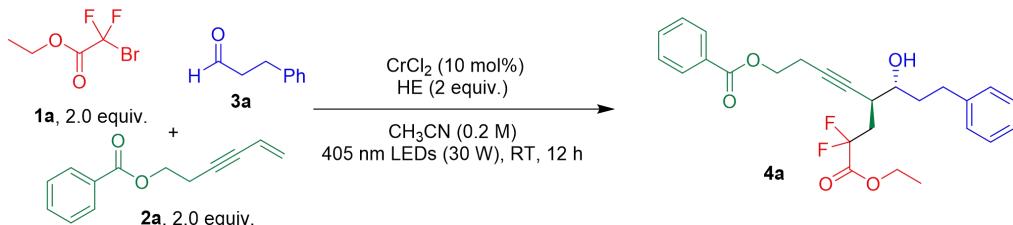

### 3. General procedures of the reaction

An oven-dried Schlenk tube equipped with an stirring bar was charged under nitrogen gas with the corresponding alkyl halides (**1**, 2.0 equiv.), 1,3-ynyl (**2**, 2.0 equiv.), aldehyde (**3**, 0.2 mmol), Hantzsch ester (HE, 2.0 equiv.), CrCl<sub>2</sub> (10 mol%), and CH<sub>3</sub>CN (0.2 M, 1.0 mL). The reaction mixture was then degassed by freeze-pump-thaw for three times, then the vessel was back-filled with nitrogen gas. The substrate was added after degassed when it's a liquid. Subsequently, the reaction was stirred at room temperature under blue LEDs irradiation (30 W, 400-410 nm) for 12 h. The reaction solution was concentrated in vacuo and filtered through a pad of silica gel by washing with EtOAc. The obtained crude reaction mixture was then concentrated for <sup>1</sup>H NMR spectroscopy to determine the diastereomeric ratio. The mixture solution was purified by column chromatography on silica gel (pentane/EtOAc) to afford the corresponding compounds.

All 1,3-enynes were prepared from the alkynes and vinyl bromide according to the previous reports.<sup>[1, 2]</sup>

### 4. The procedure of large-scale

Based on the general procedure, 3-phenylpropionaldehyde **3a** (10 mmol, 1.34 g), 1,3-ynyl **2a** (20 mmol), and ethyl bromodifluoroacetate **1a** (20 mmol), Hantzsch ester (HE, 20 mmol), CrCl<sub>2</sub> (1 mmol), and CH<sub>3</sub>CN (0.2 M, 50 mL) were stirred at room temperature under blue LEDs irradiation (30 W, 400-410 nm) for 12 h. The reaction solution was concentrated in vacuo and filtered through a pad of silica gel by washing with EtOAc. The obtained crude reaction mixture was then concentrated for <sup>1</sup>H NMR spectroscopy to determine the diastereomeric ratio. The mixture solution was purified by column chromatography on silica gel (pentane/EtOAc) to afford the corresponding compounds **4a** (3.57 g, 78%).

### 5. Mechanistic investigation

#### 5.1 UV-visible spectra absorption analysis

A variety of solution of BrCF<sub>2</sub>COOEt, HE, and HE+BrCF<sub>2</sub>COOEt with different concentration in CH<sub>3</sub>CN were prepared. Then the UV-visible absorption spectra of a series of solutions were recorded on HP 8453 spectrometer.

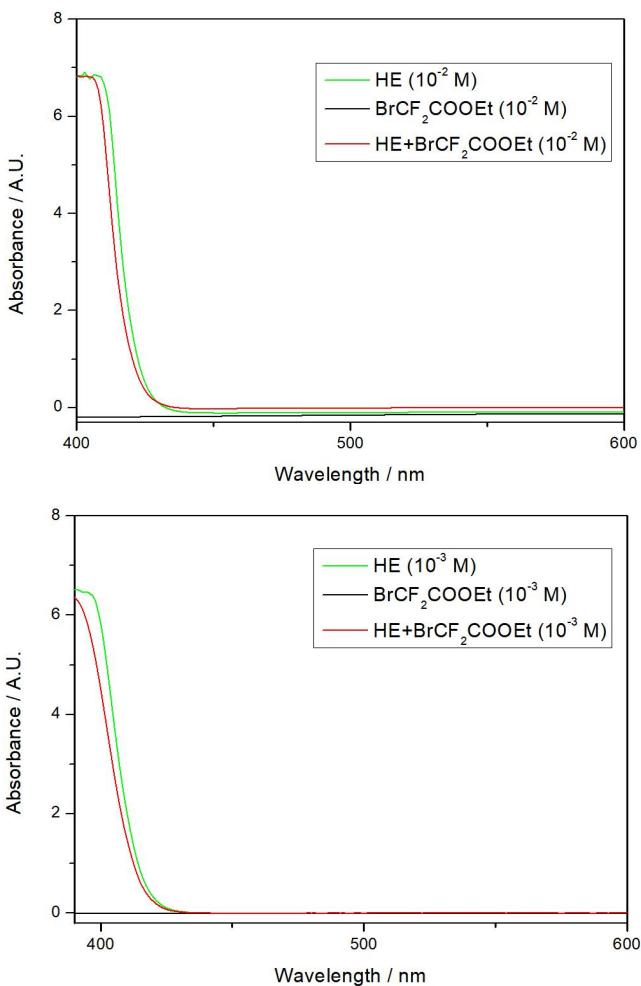

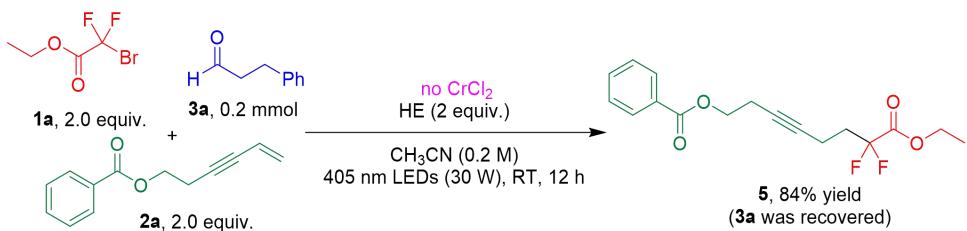

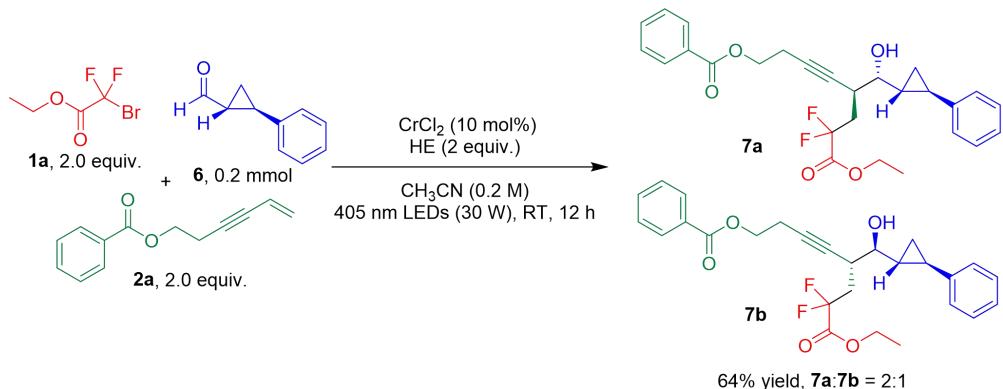

Figure S2. UV-visible absorption spectra of  $\text{BrCF}_2\text{COOEt}$ , HE, and HE+ $\text{BrCF}_2\text{COOEt}$  in  $\text{CH}_3\text{CN}$

## 5.2 Radical probing experiment I

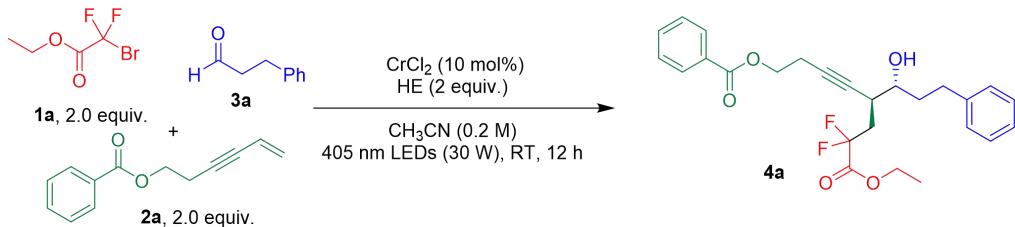

According to the general procedure, the reaction was equipped with 3-phenylpropionaldehyde **3a**, 1,3-ynye **2a**, and ethyl bromodifluoroacetate **1a**, Hantzsch ester (HE, 2.0 equiv.), and  $\text{CH}_3\text{CN}$  (0.2 M, 1.0 mL) and stirred at room temperature under blue LEDs irradiation for 12 h. The reaction solution was concentrated in vacuo and then purified by column chromatography on silica gel (pentane/EtOAc = 50:1) to afford **5** as a colorless oil.

### 5.3 Radical probing experiment II

2-phenylcyclopropane-1-carboxaldehyde **6** was used to further explore the reaction mechanism. An oven-dried Schlenk tube equipped with an stirring bar was charged under nitrogen gas with the corresponding **6**, 1,3-enyne **2a**, and ethyl bromodifluoroacetate **1a**, Hantzsch ester (HE, 2.0 equiv.),  $\text{CrCl}_2$  (10 mol%), and  $\text{CH}_3\text{CN}$  (0.2 M, 1.0 mL) and stirred at room temperature under blue LEDs irradiation for 12 h. The reaction solution was concentrated in vacuo and then purified by column chromatography on silica gel (pentane/EtOAc = 10:1) to afford colorless oil **7a** and **7b** in 2:1 ratio.

### 5.4 Light on/off experiment

The light on/off experiment of the model reaction was performed parallelly on a 1.0 mmol scale according to the general procedure by adding 1.0 equiv. 1,3,5-trimethoxybenzene as internal standard. The reaction started with successive irradiation and black periods to study the influence of continuous irradiation of the visible-light for the progress photochemical reaction. After being irradiated with 30 W blue LEDs for 1 h, an aliquot (200  $\mu\text{L}$ ) from the reaction mixture was transferred into a flask and then concentrated. The yield of the desired product **4a** was determined by  $^1\text{H}$  NMR. The reaction was then stirred with light-off for 1 h and the yield was determined by  $^1\text{H}$  NMR. All of the following yields were analyzed in the identical way after a 1 h light on or light-off. These results revealed that light is a necessary component of the reaction.

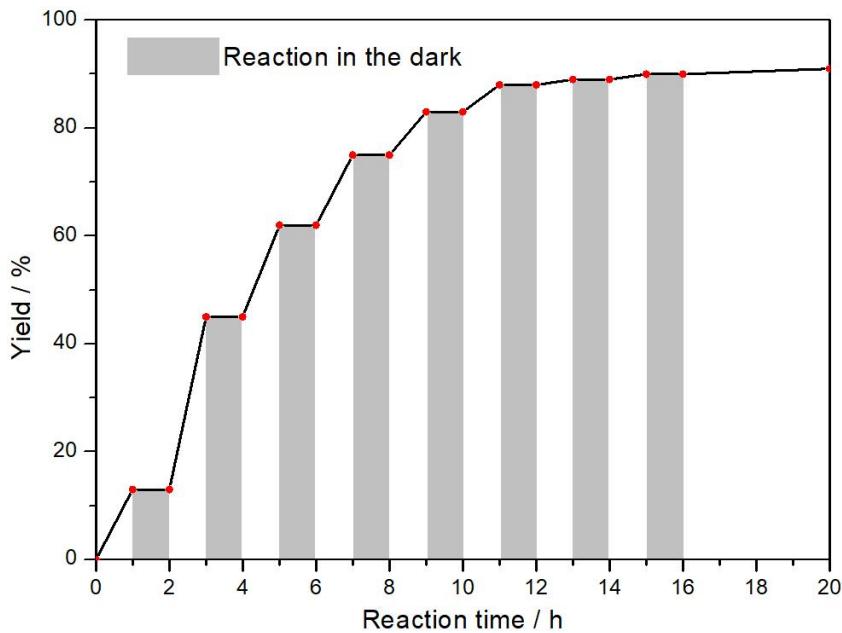

Figure S3. Time profile of the transformation with light on/off over time

### 5.5 Quantum yield calculation<sup>[4]</sup>

(A) Determination of light intensity at 436 nm:

0.737 g of potassium ferrioxalate trihydrate was dissolved in 10 mL H<sub>2</sub>SO<sub>4</sub> (0.05 M) and stored in the dark. Then, a buffer solution was prepared by dissolving 2.25 g of sodium acetate and 10 mg of phenanthroline in 10 mL of H<sub>2</sub>SO<sub>4</sub> (0.5 M).

General protocol to assess the photon flux of the 436 nm blue LEDs: 3.0 mL of the ferrioxalate solution was placed in a cuvette containing a stirring bar and irradiated for 90.0 seconds at  $\lambda = 436$  nm with an emission slit width at 10.0 nm. After irradiation, 0.525 mL of the phenanthroline solution was added to the cuvette. The solution was then allowed to stir for 1.0 h in the dark to allow the ferrous ions to completely coordinate to the phenanthroline. The absorbance of this solution was then measured at 510 nm by UV-vis spectrophotometry. The number of moles of Fe<sup>2+</sup> produced by light irradiation is obtained by:

$$n(\text{Fe}^{2+}) = \frac{V \times \Delta A}{l \times \epsilon} \quad (1)$$

Where:

V is the total volume (0.003525 L) of the solution after addition of phenanthroline;

$\Delta A$  is the difference in absorbance at 510 nm between the irradiated and non-irradiated solutions;

l is the path length (1.000 cm);

$\epsilon$  is the molar absorptivity at 510 nm (11,100 L mol<sup>-1</sup> cm<sup>-1</sup>).

The photon flux (F) is obtained by using the following equation:

$$F = \frac{n(\text{Fe}^{2+})}{\Phi \times t \times f} \quad (2)$$

Where:

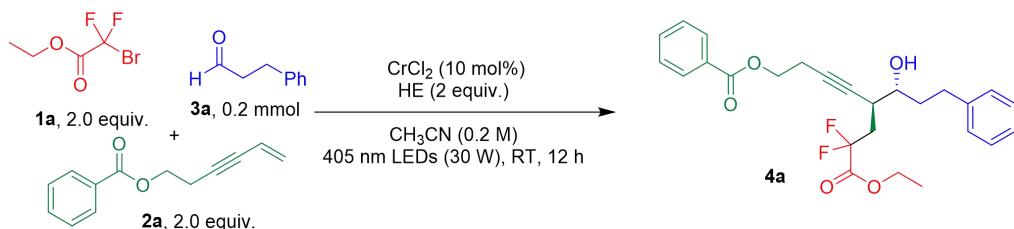

$\Phi$  is the quantum yield for the ferrioxalate actinometer (1.01 for a 0.15 M solution at  $\lambda = 436$  nm);

$t$  is the time (90.0 s);

$f$  is the fraction of light absorbed at  $\lambda = 436$  nm.

The photon flux was calculated to be  $1.58 \times 10^{-9}$  einstein  $s^{-1}$ .

(B) Quantum yield calculation of the reaction:

Following the standard procedure, an oven-dried Schlenk tube equipped with an stirring bar was charged under nitrogen gas with the corresponding alkyl halides (**1**, 2.0 equiv.), 1,3-ynye (**2**, 2.0 equiv.), aldehyde (**3**, 0.2 mmol), Hantzsch ester (HE, 2.0 equiv.),  $\text{CrCl}_2$  (10 mol%), and  $\text{CH}_3\text{CN}$  (0.2 M, 1.0 mL). The reaction mixture was then degassed by freeze-pump-thaw for three times, then the vessel was back-filled with nitrogen gas. The substrate was added after degassed when it's a liquid. Subsequently, the reaction was stirred at room temperature under blue LEDs irradiation ( $\lambda = 405$  nm, slit width = 10.0 nm) for 4 h. After irradiation, the yield was determined by  $^1\text{H}$  NMR analysis using 1,3,5-trimethoxybenzene as an internal standard. The yield was determined to be 1.8% ( $3.6 \times 10^{-6}$  mol). The reaction quantum yield ( $\Phi$ ) was determined using eq. 3 where the photon flux is  $1.58 \times 10^{-9}$  einsteins  $s^{-1}$  (determined by actinometry as described above),  $t$  is the reaction time (14400 s) and  $f$  is the fraction of incident light absorbed by the reaction mixture ( $f = 1 - 10^{-A}$ , 0.996).

$$\Phi = \frac{n(\text{product})}{F \times t \times f} \quad (3)$$

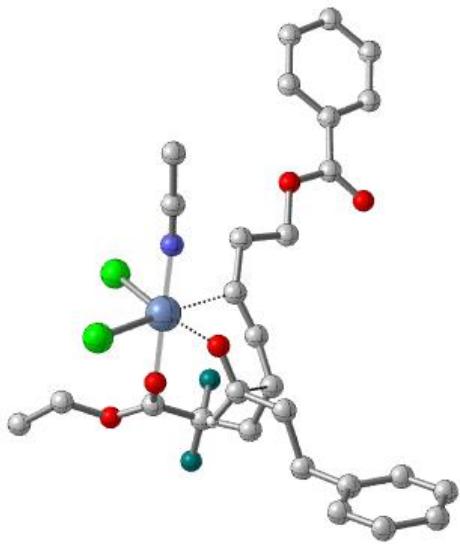

The reaction quantum yield ( $\Phi$ ) was thus determined to be  $\Phi = 0.16$ .

## 6. DFT calculations

**Computational Methods:** All of the density functional theory (DFT) calculations were performed with the Gaussian 16<sup>[5]</sup> series of programs. The B3LYP functional<sup>[6]</sup> including Grimme empirical dispersion correction (GD3BJ)<sup>[7]</sup> with the standard 6-31G(d) basis set (SDD basis set for Cr) was used for the geometry optimizations in the gas phase. Harmonic vibrational frequency calculations were performed for all of the stationary points to determine whether they are transition structures and to derive the thermochemical corrections for free

energies. The M06L functional<sup>[8]</sup> proposed by Truhlar et al. with the 6-311+G(d,p) basis set (SDD basis set for Cr) was used to calculate the single-point energies. The solvent effect was considered by applying the implicit SMD<sup>[9]</sup> solvation model with MeCN as solvent in single-point energy calculations. The 3D images of the calculated structures were prepared using CYLview.<sup>[10]</sup>

471 MHz, CDCl<sub>3</sub>

A vertical column of chemical shifts is shown, ranging from -102.66 ppm at the top to -106.52 ppm at the bottom. The values are: -102.66, -102.69, -102.72, -103.21, -103.25, -103.28, -105.89, -105.93, -105.97, -106.44, -106.48, and -106.52.

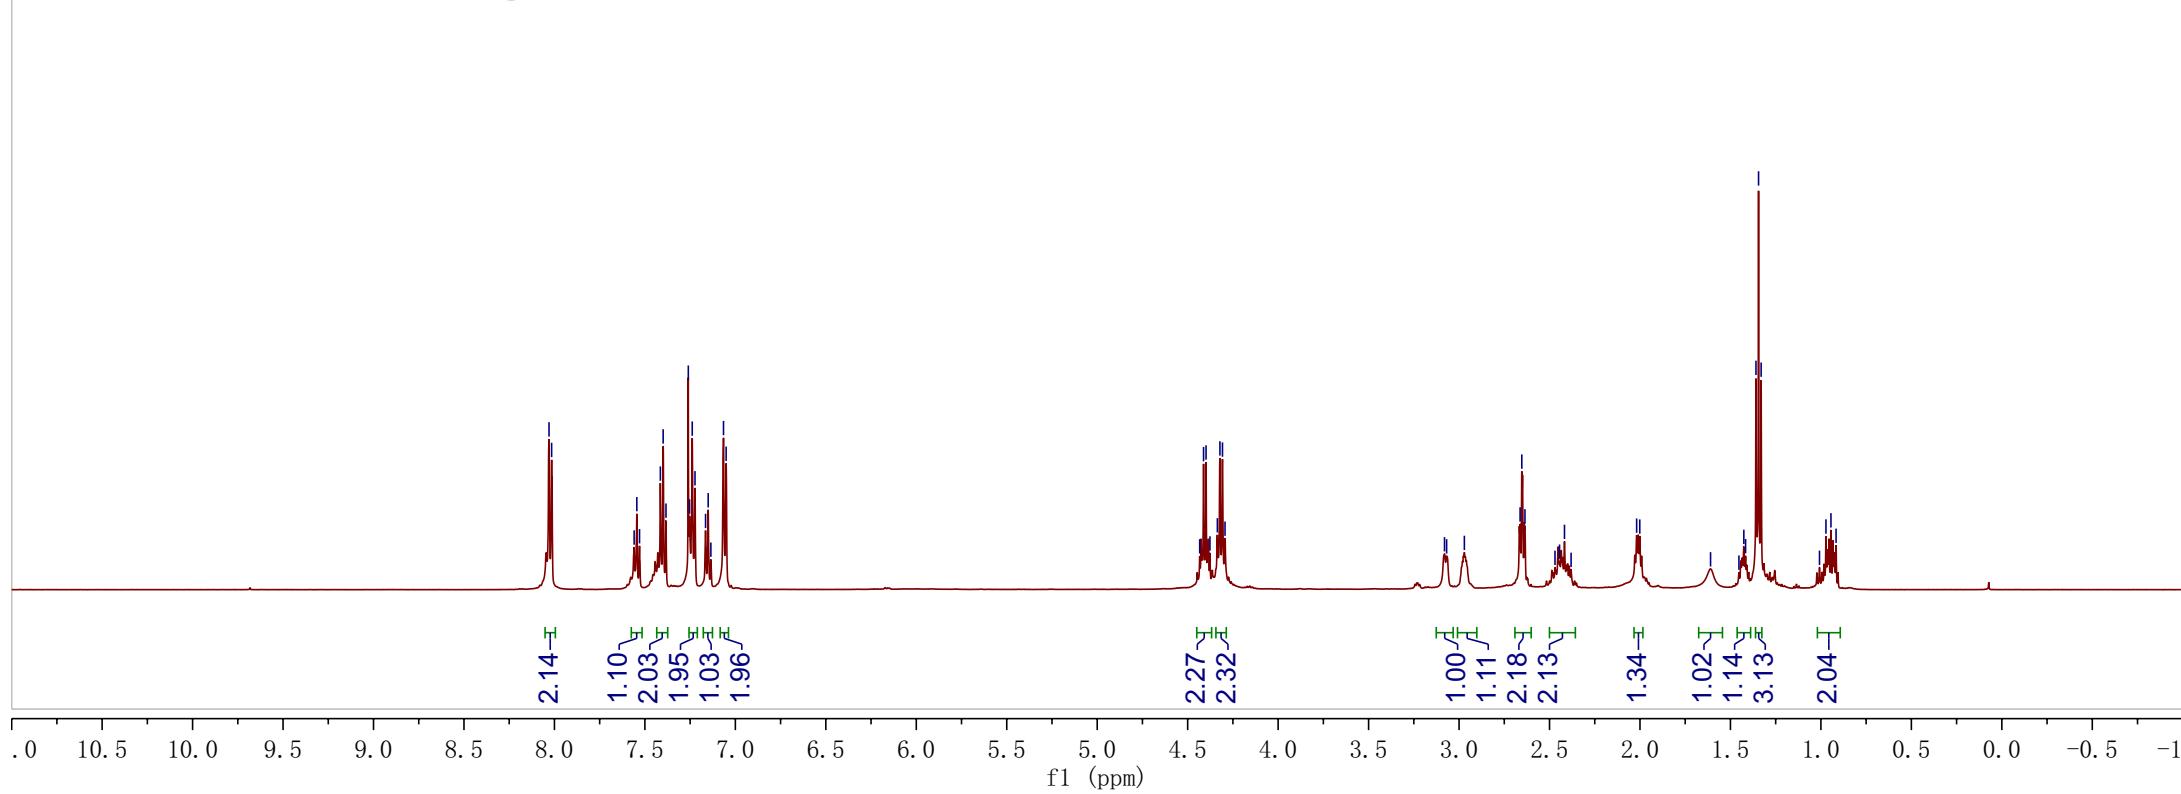

Integration values are displayed below the x-axis: 1.00 (green bracket) and 0.99 (blue bracket).
