Experimental Section

General Considerations. All manipulations were performed under rigorous exclusion of air and moisture, using standard Schlenk, high-vacuum, and glovebox techniques (MB Braun MB200B; < 0.1 ppm O₂, < 0.1 ppm H₂O, argon atmosphere). The solvents *n*-hexane, *n*-pentane, diethyl ether, toluene and tetrahydrofuran (THF) were purified using Grubbs columns (MBraun SPS, solvent purification system). Tetrahydrofuran was stored over freshly activated molecular sieves (3 Å). 2,6-Diisopropylaniline (H₂NAr^{iPr}, 97%, Sigma-Aldrich), 2,6-dimethylaniline (H₂NAr^{Me}, 99%, Sigma-Aldrich), and 2,4,6-trimethylaniline (H₂NAr^{Mes}, 98%, Sigma-Aldrich) were dried over CaH₂ and purified by distillation. 1-Adamantylamine (H₂NAd, 97%, Sigma-Aldrich) was used without further purification. All solvents and reagents were stored inside a glovebox. C₆D₆ and toluene-*d*₈ were obtained from *Aldrich* or *eurisotop*, degassed, dried over Na for 24 h and filtered. HTp^{tBu,Me} and KTp^{tBu,Me} (Tp^{tBu,Me} = hydrotris(3-tert-butyl-5-methylpyrazol)borate) were synthesized by a modification of the published procedure of HTp^{tBu,Ph}.¹ Ln(AlMe₄)₃ and Ln(GaMe₄)₃ (Ln = Y, Dy, Ho) were synthesized according to literature procedures.^{2,3} The NMR spectra of air and moisture sensitive compounds were recorded by using *J. Young*-valved NMR tubes on a *Bruker AVII+400* spectrometer (¹H: 400.13 MHz) and AV500 or *Bruker AVII+500* (5 mm BBO, ¹H: 500.13 Hz; ¹³C: 125.77 MHz). ¹H NMR resonances are referenced to solvent residual resonances and reported in *parts per million*, relative to tetramethylsilane (TMS). Coupling constants are given in Hertz. IR spectra were recorded on a *NICOLET 6700 FTIR* spectrometer with a DRIFT cell (KBr window), and the samples were prepared in a glovebox and mixed with KBr powder. Elemental analyses were performed on an *Elementar Vario Micro Cube*.

X-ray Crystallography and Crystal Structure Determinations. Single crystals of the reported compounds **1-Ln – 9-Ln** were grown by standard techniques from saturated solutions using toluene. Suitable crystals for X-ray structure analyses were selected in a glovebox and coated with Parabar 10312 (previously known as Paratone N, Hampton Research) and fixed on a nylon loop/glass fiber.

X-ray data for above mentioned compounds, except for **1-Ho^{Ga}** and Ho(Ga(CH₃)₄)₃, were collected on a Bruker APEX II DUO (all remaining; instruments equipped with an I μ S microfocus sealed tube and QUAZAR optics for MoK α ($\lambda = 0.71073 \text{ \AA}$) and CuK α ($\lambda = 1.54184 \text{ \AA}$) radiation. **1-Ho^{Ga}** was measured on a Bruker SMART APEX II instrument equipped with a fine focus sealed tube and TRIUMPH monochromator using MoK α radiation ($\lambda = 0.71073 \text{ \AA}$). The data collection strategy was determined using COSMO⁴ employing ω -scans. Raw data were processed using APEX II/III⁵ and SAINT,⁶ corrections for absorption effects were applied using SADABS.⁷ Data for Ho(Ga(CH₃)₄)₃ were collected at 173(2) K on a STOE IPDS II system, equipped with a fine focus sealed tube and graphite monochromator using MoK α radiation ($\lambda = 0.71073 \text{ \AA}$) performing ϕ -scans. Raw data were collected and integrated using Stoe's X-Area^[8] software package. Absorption correction has been done using X-Red^[9] and X-Shape^[10]. The structures were solved by direct methods and refined against all data by full-matrix least-squares methods on F² using ShelXL¹¹ and ShelXle.¹² All graphics were produced employing ORTEP-3¹³ and POV-Ray.¹⁴ Further details of the refinement and crystallographic data are listed in Table S1-S5, and in the CIF files. CCDC depositions 2312212-2312226 contain all the supplementary crystallographic data for this paper. These data can be obtained free of charge from The Cambridge Crystallographic Data Centre via www.ccdc.cam.ac.uk/structures/.

NMR spectroscopy

Notes on NMR spectroscopic characterizations.

Due to the paramagnetic nature of Dy(III) and Ho(III) any conclusive interpretation of the recorded NMR spectra was not possible. In general, solvent peaks are marked with an asterisk (*).
