¹H NMR of lignin models

Reference

General information

All chemical reagents are obtained from commercial suppliers and used without further purification. 5% Ru/C (wetted with ca. 50% Water), 5% Pd/C (wetted with ca. 50% Water), 5% Pt/C (wetted with ca. 50% Water), and 5% Rh/C (wetted with ca. 50% Water) were purchased from Alfa Aesar. The quantitative analysis of product distribution was conducted by gas chromatography (GC), which was performed on an Agilent 8890 Gas chromatograph with a flame ionization detector equipped with OV-1701 capillary columns (30 m × 320 μm). The XRD results were collected on a Rigaku Ultima IV X-Ray diffractometer operating in Bragg-Brentano focusing geometry and using CuK α radiation from a generator operating at 40 kV and 40 mA. The transmission electron microscopy (TEM) images, high-resolution (HR) TEM images, and STEM-EDX mapping images were collected on an FEI Talos F200S. ¹H NMR spectra were taken on Varian Inova 600 with TMS as an internal standard and CDCl₃ as solvent. HSQC NMR spectra were measured on a Bruker Avance NEO 600 MHz spectrometer with CD₃OD as solvent.

Extraction of birch lignin

The birch sawdust (40-80 mesh, 30 g) was added into an autoclave reactor and charged with MeOH (200 mL), and the mixture was heated at 180°C under Ar atmosphere for 3 h. The mixture was cooled and filtrated. The filtrate was concentrated in vacuo, and the residue was precipitated by THF/n-hexane (150 mL). The fine lignin was obtained through drying in vacuo at 40°C as a brown solid (2.7 g).

The conversion of realistic organosolv birch lignin to amine monomers

Organosolv birch lignin (100 mg), 5% Ru/C (25 mg), and THF (5 mL) were added to an autoclave reactor. The autoclave reactor was flushed with H₂ 5 times, and 0.8 MPa

and 4.2 MPa H₂ were charged into the autoclave reactor. The reaction was conducted at 220°C for 72 hours. Then the reactor was cooled to room temperature. The mixture was filtered using a filter membrane and the solution was analyzed by GC-MS. The solvent was removed in vacuo. Residues were dissolved in CD₃OD and filtered using a filter membrane. The filtrate was analyzed by 2D ¹³C-¹H HSQC NMR.

Catalyst Evaluation

The catalytic reaction was carried out in an autoclave reactor, and 2.5 mmol lignin model compounds, catalyst, and 5 mL n-hexane were charged into the reactor. After the reactor was flushed with H₂ 5 times, the autoclave reactor was charged with 0.8 MPa ammonia and 2.2 MPa H₂, and the reaction was conducted at 200°C for 2 hours with a stirring speed of 600 rpm. After the reaction, the reactor was cooled to room temperature with ice water, and the reaction solution was diluted with CH₂Cl₂ and analyzed by gas chromatography (GC) analysis on an Agilent 8890 Gas chromatograph with flame ionization detector equipped with OV-1701 capillary columns (30 m × 320 μm). n-Hexadecane was used as an internal standard to calibrate the organic product concentrations and carbon balances. The carbon balances for all of the reported experiments were better than 90%.

For the kinetic data, the results were collected at time durations.

Calculation of conversion, yield, and selectivity:

$$Conv.(%) = \frac{(n_{lignin\ model})_0 - (n_{lignin\ model})_{end}}{(n_{lignin\ model})_0} * 100\%$$

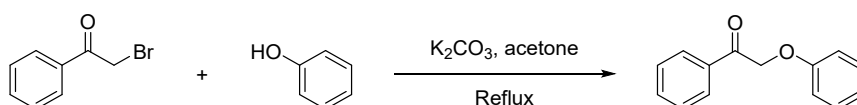

$$Sel.(xi)(%) = \frac{n_{xi}}{n_{x1} + n_{x2} + n_{x3} + \dots + n_{xn}} * 100\%$$

$$Yield(xi)(%) = \frac{n_{xi}}{(n_{lignin\ model})_0} * 100\%$$

Synthesis of β -O-4 linkage model compounds.

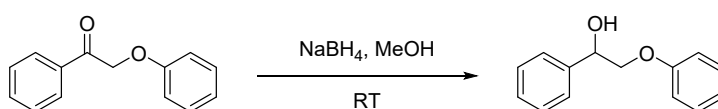

All substrates have been prepared according to literature procedures with minor modifications.¹

Synthesis of 2-phenoxy-1-phenylethan-1-one

A 1 L three-necked round-bottomed flask equipped with a reflux condenser and a dropping funnel was charged with phenol (5.2 g, 55 mmol) and K₂CO₃ (10.4 g, 76 mmol) in acetone (250 mL) and stirred at RT. To this suspension, 2-bromoacetophenone (10.0 g, 50 mmol) in acetone (50 mL) was added dropwise over 45 min at RT. The resulting suspension was stirred at reflux for 4 h, then the suspension was filtered out and the filtrate was concentrated in vacuo. The crude product was purified by recrystallization from petroleum ether to give 2-phenoxy-1-phenylethanone as a white solid (7.47 g, 4.9 mmol) in 71% yield. ¹H NMR (600 MHz, CDCl₃) δ 8.01-7.98 (m, 2H), 7.62-7.58 (m, 1H), 7.50-7.47 (m, 2H), 7.29-7.26 (m, 2H), 6.99-6.96 (m, 1H), 6.96-6.93 (m, 2H), 5.26 (s, 2H).

Synthesis of 2-phenoxy-1-phenylethan-1-ol

A 500 mL round bottom flask was charged with 2-phenoxy-1-phenylethanone (4.25 g, 20.0 mmol) and methanol (100 mL). Sodium borohydride (0.83 g, 22.0 mmol) was added to the solution in small portions at 0°C, the suspension was stirred at 0°C until the reaction is finished. After the reaction is completed, 100 mL of saturated aqueous NH₄Cl was charged into the reaction flask, followed by the addition of ethyl acetate (250 mL). After separation, the organic phase was washed with H₂O (100 mL X 2) and saturated with aqueous NaCl (100 mL), and dried over anhydrous Na₂SO₄, filtered and the organic phase was evaporated in vacuum. The crude product was purified by recrystallization from hexane to give 3.91 g white crystalline in 90% yield. ¹H

NMR (600 MHz, CD₃OD) δ 7.46-7.44 (m, 2H), 7.37-7.34 (m, 2H), 7.30-7.27 (m, 1H), 7.25-7.22 (m, 2H), 6.91-6.89 (m, 3H), 5.02 (t, J = 6.0 Hz, 1H), 4.04 (d, J = 6.0 Hz, 2H).
