Figure S1. DRIFTS spectra in the $4000-3500 \mathrm{~cm}^{-1} v(\mathrm{OH})$ region of the $\mathrm{PdAu} / \mathrm{SiO}_{2}$ containing 0 , 5 , and $10 \mathrm{wt} \% \mathrm{~K}$ treated in (a) 0 , (b) 100 , and (c) $50 \mathrm{vol} \% \mathrm{AcOH}$ solutions showing negative $v(\mathrm{OH})$ peaks associated with conversion of isolated silanols to either silyl acetates or alkali silanolates. As-synthesized $\mathrm{PdAu} / \mathrm{SiO}_{2}$ was used as background for all samples.

(b)

Figure S2. Integrated intensities of $v(\mathrm{C}=\mathrm{O})$ and $v_{a s}(\mathrm{COO})$ peaks associated with various Pd acetates determined by deconvoluted DRIFTS spectra of the $\mathrm{PdAu} / \mathrm{SiO}_{2}$ treated in (a) 0 , (b) 100 , and (c) $50 \mathrm{vol} \% \mathrm{AcOH}$ solutions versus $\mathrm{K} \mathrm{wt} \%$ loading.

Figure S3. DRIFTS spectra in the $2000-1100 \mathrm{~cm}^{-1}$ acetate region of the $\mathrm{PdAu} / \mathrm{SiO}_{2}$ containing 0,5 , and $10 \mathrm{wt} \% \mathrm{~K}$ treated in (a) 0 , (b) 100 , and (c) $50 \mathrm{vol} \% \mathrm{AcOH}$ solutions after washing with water and drying overnight showing disappearance of acetate vibrational modes. As-synthesized $\mathrm{PdAu} / \mathrm{SiO}_{2}$ was used as background for all samples.

Figure S4. (a) $\mathrm{PdAu} / \mathrm{SiO}_{2}$ samples after wet impregnation and (b) filtrate collected after washing $\mathrm{PdAu} / \mathrm{SiO}_{2}$ samples with water showing color change versus AcOH vol $\%$ and K wt $\%$ loading.

## Design of Experiments (DOE) and Statistical Analysis

Statistical analysis based on the design of experiments (DOE) presented in Table 1 of the Main Text was performed on 8 response variables selected from XRD, XPS, DRIFTS, XAS, and ICPOES data: 1) Au grain size, 2) PdAu grain size, 3) Pd surface content, 4) $\mathrm{Pd}^{2+}$ content, 5) monodentate acetate content on surface Pd , 6) $\mathrm{Pd}_{3}(\mathrm{OAc})_{6}$ content, 7) $\mathrm{K}_{2} \mathrm{Pd}_{2}(\mathrm{OAc})_{6}$ content, and 8) Pd loss after washing. The values of the responses are summarized in Tables S5-S7 based on the AcOH vol $\%$ and $\mathrm{K} \mathrm{wt} \%$ treatments for each sample.

Each of the responses were fit using Minitab software based on a least-squares linear regression model containing all linear, quadratic, and interaction effects of the two factors AcOH $\mathrm{vol} \%$ and $\mathrm{K} \mathrm{wt} \%$ (Equation 3 in the Main Text). The response surface plots are presented in Figures 9 and 10 of the Main Text. The fitting coefficients and their standard errors for all the response surface plots are presented in Tables S8-S15.

Coded coefficients were also calculated in Minitab by centering and scaling the variables so that the low and high factor levels coded as -1 and 1 , respectively. The transformation to coded coefficients is necessary in order to orthogonalize the factors and isolate the factor effects, allowing for relative comparisons between different effects. For example, a larger coded coefficient means that effect has a greater relative contribution to the response surface model. The coded coefficients and their standard errors for each response are also presented in Tables $\mathrm{S} 8-\mathrm{S} 15$.

The coded coefficients are then used to analyze which effects have statistically significant contributions to the response surface models. The $t$-values for each coefficient are calculated as the ratio between the value of the coefficient and its standard error. The two-tailed $p$-values are then calculated by the following equation:

$$
\begin{equation*}
p=2 *(1-P(T \leq|t|, d . f .)) \tag{S1}
\end{equation*}
$$

where $|t|$ is the absolute value of the $t$-value, $d$. $f$. is the degree of freedom calculated by subtracting the number of coefficients from total number of runs (d.f. $=5$ for a model with 6 coefficients and 11 runs), and $P(T \leq|t|, d . f$. $)$ is the cumulative distribution function for a $t$ distribution at a particular $t$-value and degree of freedom. The calculated $t$-values and $p$-values are included in Tables S8 - S15. At the $95 \%$ confidence level $(\alpha=0.05)$ with 5 degrees of freedom, $p$ $\leq 0.05$ and $t \geq 2.571$ indicate statistical significance. Plotting the absolute value of the $t$-values in a Pareto chart of the standardized effects offers a visual representation to determine the degree of statistical significance for each factor (Figures S9 - S16).
