Partial Conductivities

The total conductivity of $\text{La}_{0.95}\text{M}_{0.05}\text{ScO}_{3-\delta}$ ($\text{M} = \text{Ca}, \text{Sr}, \text{Ba}$) as a function of $p\text{O}_2$ in a dry ($p\text{H}_2\text{O} = 0.1 \text{ kPa}$) and wet ($p\text{H}_2\text{O} = 2.8 \text{ kPa}$) atmosphere was measured by the 4-probe DC method and is shown in Fig. S1. Under air conditions, the conductivity contains three contributions:

$$\sigma_t = \sigma_H + \sigma_O + \sigma_h, \quad (1)$$

where σ_H , σ_O and σ_h are the proton, oxygen-ion and hole conductivities, respectively.

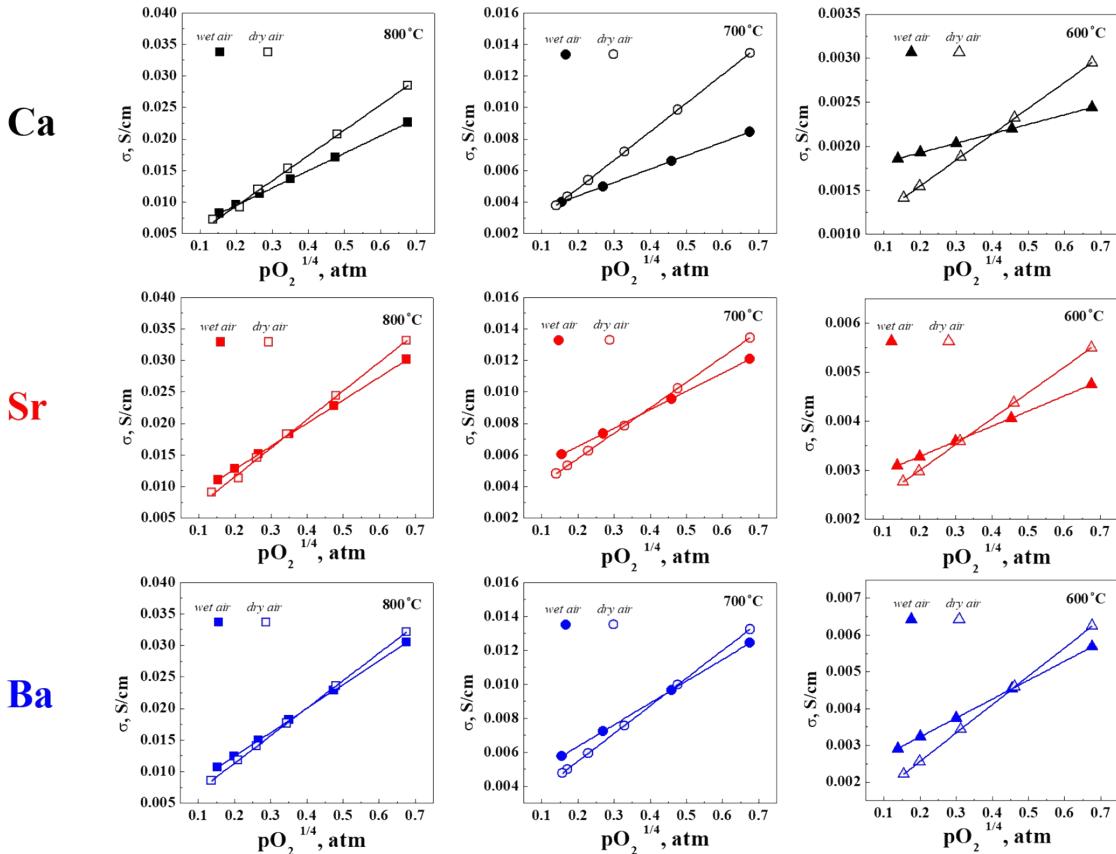

Fig. S1 Total conductivity vs. $p\text{O}_2^{1/4}$ dependencies for $\text{La}_{0.95}\text{M}_{0.05}\text{ScO}_{3-\delta}$ ($\text{M} = \text{Ca}, \text{Sr}, \text{Ba}$)

Frade¹ and Baek² proposed an approach for calculating partial conductivities based on slope analysis of $\sigma = f(p\text{O}_2)$ dependencies. This approach implies the independence of the mobility of charge carriers on the concentration of components of the gas phase. The following relations are obtained for partial conductivities:

$$\sigma_H = \sigma_H^* \left(\left(1 + \frac{\alpha}{p\text{H}_2\text{O}} \right)^{1/2} - 1 \right) \frac{p\text{H}_2\text{O}}{[(1 + \alpha)^{1/2} - 1]}, \quad (2)$$

$$\sigma_O = \sigma_O^* \left(\left(1 + \frac{\alpha}{p\text{H}_2\text{O}} \right)^{1/2} - 1 \right)^2 \frac{p\text{H}_2\text{O}}{\alpha}, \quad (3)$$

$$\sigma_h = \sigma_h^* \left(\left(1 + \frac{\alpha}{pH_2O} \right)^{1/2} - 1 \right) \left(\frac{pH_2O}{\alpha} \right)^{1/2} pO_2^{1/4}, \quad (4)$$

where σ_H^* is protonic conductivity at $pH_2O = 1$ atm, σ_O^* is oxygen-ion conductivity at $pH_2O = 0$ atm and σ_h^* is hole conductivity at $pO_2 = 1$ atm and $pH_2O = 0$ atm. The value of α is equal to:

$$\alpha = \frac{8x_{eff}}{K_H}, \quad (5)$$

where x_{eff} is the saturation limit for hydration or effective concentration of the dopant in the positions of La and K_H is the equilibrium constants of hydration.

Based on equation (7), we can find σ_h as the slope of the experimental dependence $\sigma_t = f(pO_2)^{1/4}$. The α value can be calculated by combining two equations (4) for two humidity values and obtaining the following equation:

$$\frac{\sigma_h^{(1)}}{\sigma_h^{(2)}} = \frac{\sigma_h^* \left(\left(1 + \frac{\alpha}{pH_2O^{(1)}} \right)^{1/2} - 1 \right) \left(\frac{pH_2O^{(1)}}{\alpha} \right)^{1/2}}{\sigma_h^* \left(\left(1 + \frac{\alpha}{pH_2O^{(2)}} \right)^{1/2} - 1 \right) \left(\frac{pH_2O^{(2)}}{\alpha} \right)^{1/2}} = \frac{\left(1 + \frac{pH_2O^{(1)}}{\alpha} \right)^{1/2} - \left(\frac{pH_2O^{(1)}}{\alpha} \right)^{1/2}}{\left(1 + \frac{pH_2O^{(2)}}{\alpha} \right)^{1/2} - \left(\frac{pH_2O^{(2)}}{\alpha} \right)^{1/2}}. \quad (6)$$

The resulting α values at different temperatures are shown in Table S1.

Table S1 The values of α calculated for $\text{La}_{0.95}\text{M}_{0.05}\text{ScO}_{3-\delta}$ ($\text{M} = \text{Ca, Sr, Ba}$) at different temperatures

T, °C	α , atm		
	$\text{La}_{0.95}\text{Ca}_{0.05}\text{ScO}_{3-\delta}$	$\text{La}_{0.95}\text{Sr}_{0.05}\text{ScO}_{3-\delta}$	$\text{La}_{0.95}\text{Ba}_{0.05}\text{ScO}_{3-\delta}$
800	0.1286	0.4258	0.8934
700	0.0200	0.1605	0.3022
600	0.0091	0.0540	0.1011

Next, we can find σ_H and σ_O from the value of the total ionic conductivity (σ_i , the intercept with the vertical axis of $\sigma_t = f(pO_2)^{1/4}$ experimental dependency) by combining equations (2) and (3) for two humidity values:

$$\frac{\sigma_i^{(1)}}{\sigma_i^{(2)}} = \frac{\sigma_H^{(1)} + \sigma_O^{(1)}}{\sigma_H^{(2)} + \sigma_O^{(2)}} = \frac{\sigma_H^* \left(\left(1 + \frac{\alpha}{pH_2O^{(1)}} \right)^{1/2} - 1 \right) \left(\frac{pH_2O^{(1)}}{[(1+\alpha)^{1/2}-1]} \right)^{1/2} + \sigma_O^* \left(\left(1 + \frac{\alpha}{pH_2O^{(1)}} \right)^{1/2} - 1 \right)^2 \frac{pH_2O^{(1)}}{\alpha}}{\sigma_H^* \left(\left(1 + \frac{\alpha}{pH_2O^{(2)}} \right)^{1/2} - 1 \right) \left(\frac{pH_2O^{(2)}}{[(1+\alpha)^{1/2}-1]} \right)^{1/2} + \sigma_O^* \left(\left(1 + \frac{\alpha}{pH_2O^{(2)}} \right)^{1/2} - 1 \right)^2 \frac{pH_2O^{(2)}}{\alpha}}. \quad (7)$$

XRD and PDF

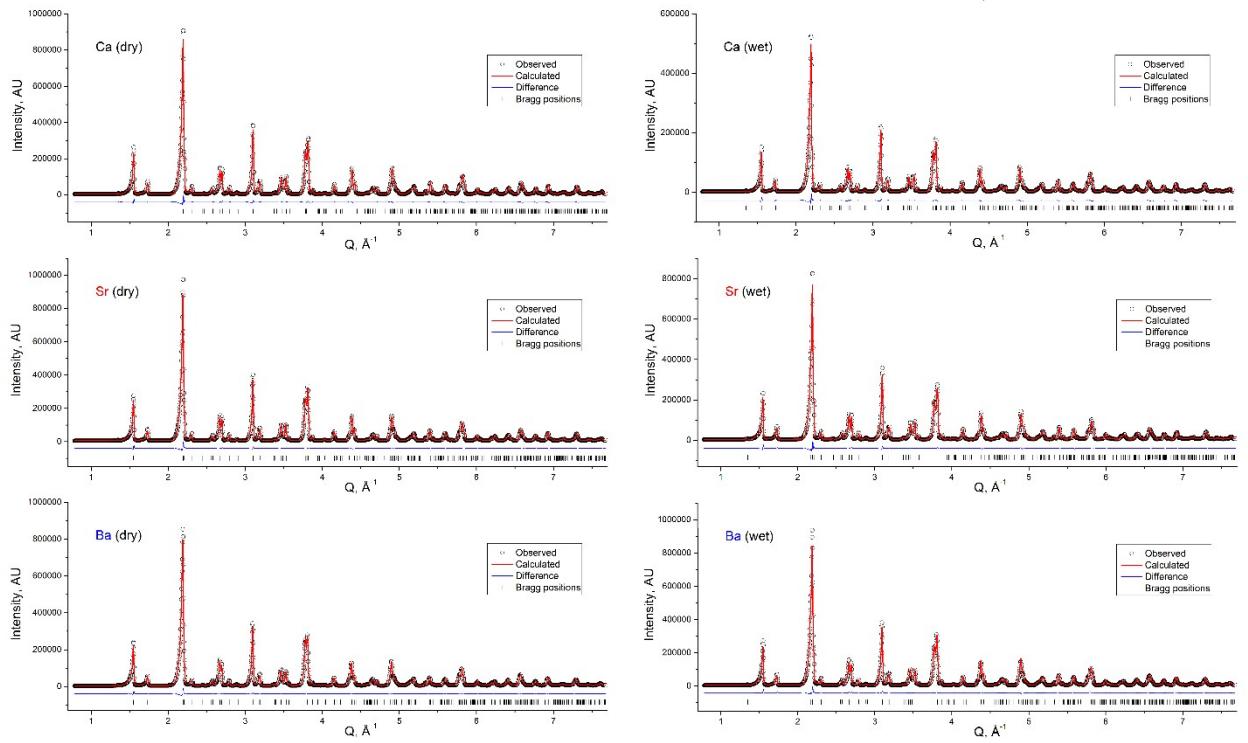

Fig. S2 XRD patterns with Rietveld refinements for $\text{La}_{0.95}\text{M}_{0.05}\text{ScO}_{3-\delta}$ ($\text{M} = \text{Ca}, \text{Sr}, \text{Ba}$) samples in dry and saturated with water (wet) states

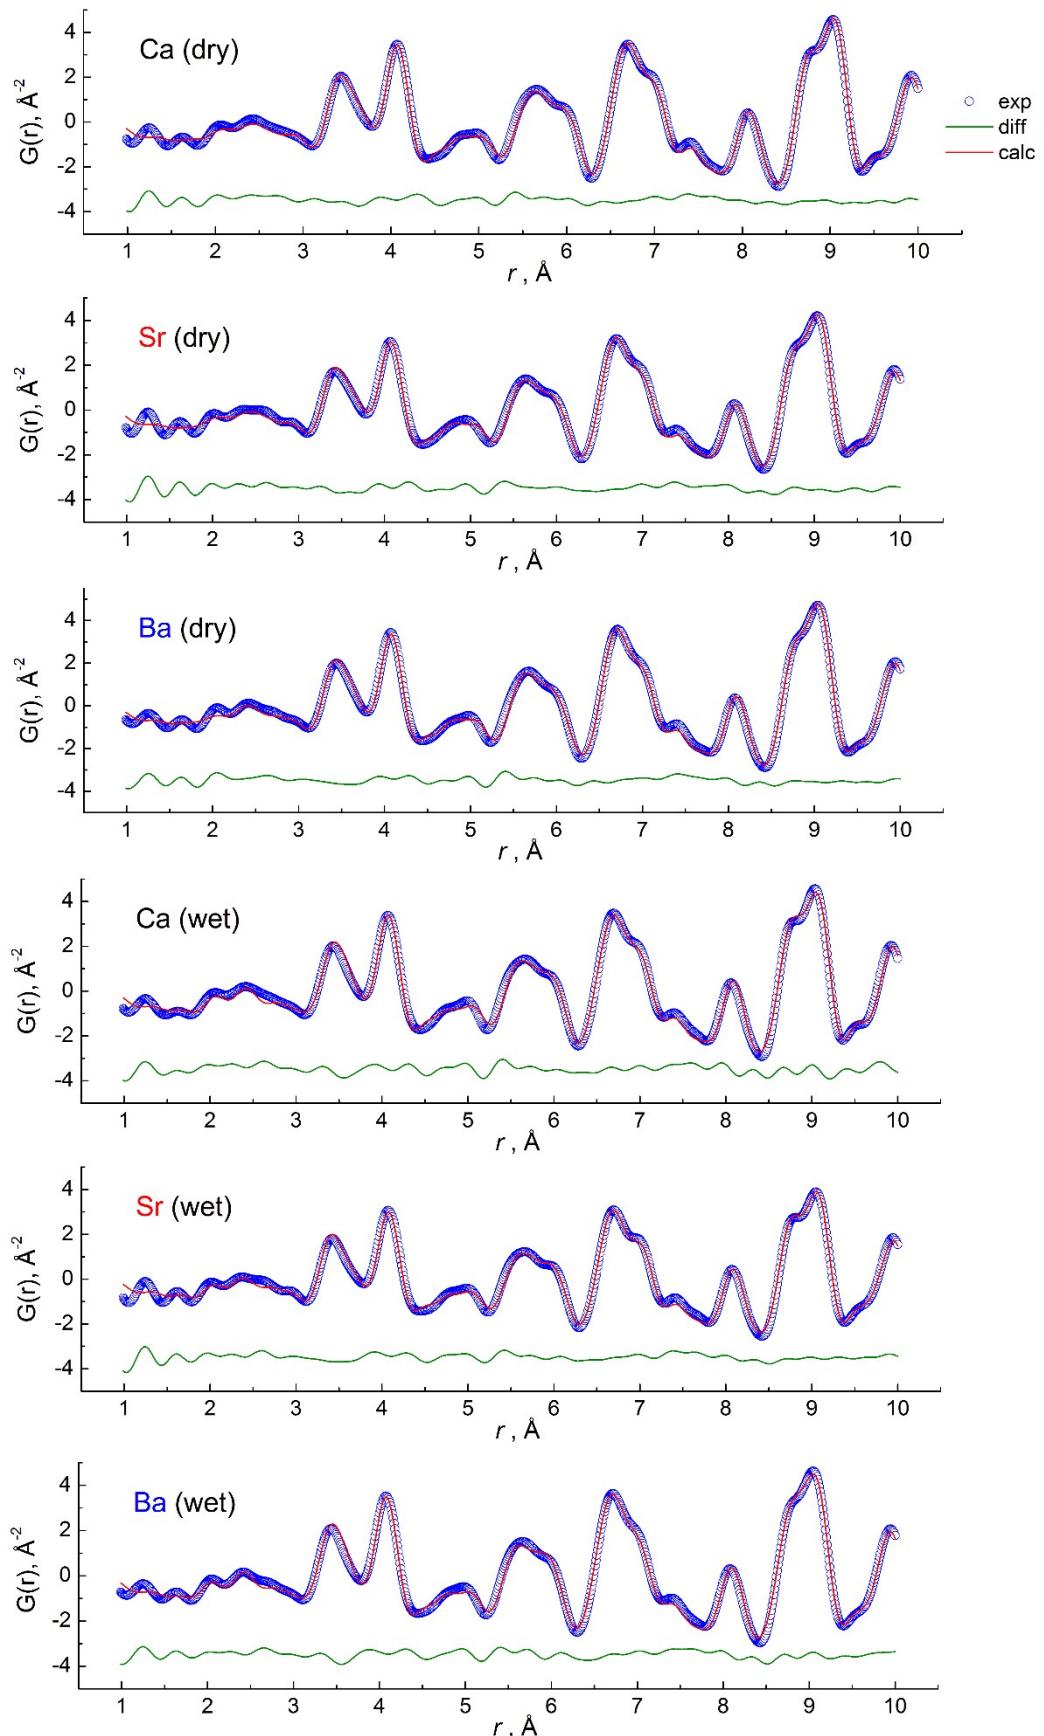

Fig. S3 Refined local structure using X-ray PDF for $\text{La}_{0.95}\text{M}_{0.05}\text{ScO}_{3-\delta}$ ($\text{M} = \text{Ca}, \text{Sr}, \text{Ba}$) samples in dry and saturated with water (wet) states

Interatomic distances were calculated for the indicated atoms (according to the type of atom) up to 10 Å. There are 4 A-type positions, 4 B-type positions, 8 O1-type positions and 4 O2-type positions in the original unit cell. Atoms are numbered in the following order: La 1-4, Sc 5-8, O1 9-16 and O2 17-20. Table S2 presents the interatomic distances for the first coordination spheres of atoms, which corresponds to the lengths of chemical bonds.
