Experimental Procedures

S1: Expression and purification of D-lactate dehydrogenase and glucose dehydrogenase

Based on the previous research¹, our laboratory (Taizhou Key Laboratory of Biomass Functional Materials Development and Application) preserved *E. coli*/D-lactate dehydrogenase(D-LDH, abbreviated as LDH) engineering bacteria and *E. coli*/glucose dehydrogenase (GDH) engineering bacteria. The steps for the expression and purification of two-enzyme are as follows.

The expression strain was grown in Luria–Bertani (LB) medium containing 50 $\mu\text{g}\cdot\text{mL}^{-1}$ kanamycin at 180 rpm and 37 °C for 10 h. Then, the pre-culture was transferred to a fresh LB/kanamycin medium for further growth at 37 °C and 180 rpm. After 2 h, lactose with a final concentration of 10 $\text{g}\cdot\text{L}^{-1}$ was added to induce expression, and the culture was continued for 12 h at 28 °C and 150 rpm. Cells were collected by centrifugation at 6300 $\times g$ and 4 °C for 10 min, and crude enzyme solution was obtained from lysed cells.

The crude enzyme was loaded onto a Ni^{2+} -nitrilotriacetic acid column (1.6 cm \times 10 cm, BioRad, USA) pre-equilibrated with Buffer A (20 mM potassium phosphate buffer, pH 8.0, 500 mM NaCl and 20 mM imidazole). Buffer B (20 mM potassium phosphate buffer pH 8.0, 500 mM NaCl and 500 mM imidazole) was used to elute the enzyme at a flow rate of 1.0 $\text{mL}\cdot\text{min}^{-1}$. The purified enzyme was collected and dialyzed overnight against 20 mM potassium phosphate buffer (pH 8.0) to remove salt ions and imidazole.

S2: Characterization of LDH/GDH-ZIFs biocomposites

Powder X-ray Diffraction (XRD): XRD patterns were obtained using a Bruker D8 Advance X-ray diffractometer with $\text{K}\alpha$ radiation ($\lambda = 1.5405 \text{ \AA}$) from a Cu anode. The scan speed was 10 $^{\circ}\cdot\text{min}^{-1}$, with a 0.02 $^{\circ}$ step, and the diffraction data were collected over a range of $2\theta = 5\text{-}40^{\circ}$.

Thermogravimetric Analysis (TGA): TGA data were collected using a TA instruments synchronous thermal analyzer (STA) (TGA/DSC). A sample of approximately 5 mg was placed on a ceramic pan and heated from 30 to 800 °C at a rate of 5 $^{\circ}\text{C}\cdot\text{min}^{-1}$. Each sample was heated in a constant flow of air.

Fourier transform infrared (FT-IR) spectroscopy: FT-IR spectra were recorded on a Nicolet 5700 FTIR spectrometer using samples of approximately 1 mg. Thirty-two scans were recorded over the range of 4000–650 cm^{-1} .

Scanning Electron Microscope (SEM)/Energy Dispersive Spectrometer (EDS): SEM images were recorded using a Hitachi S-4800 field-emission scanning electron microscope (FESEM). The elemental composition was determined using an energy-dispersive spectrometer (EDS).

Gas Sorption: Gas adsorption isotherms were recorded on an ASAP-2020-HD88 surface characterization analyzer. Samples comprising approximately 30 mg were placed into a glass analysis tube and degassed under a dynamic vacuum for 12 h at 105 °C before measurement. Nitrogen (N₂) adsorption and desorption isotherms were measured at 277 K.

X-Ray photoelectron spectroscopy (XPS): XPS analysis was performed using Thermo Fisher Scientific K-Alpha, Al K α radiation ($h\nu=1253.6$ eV).

Circular dichroism spectra (CDs): CD data was obtained by Applied Photophysics Chirascan to evaluate the possible secondary structure changes of the enzyme. The LDH-aZIF-90, GDH-aZIF-90, LDH/GDH-aZIF-90, free LDH, free GDH, and free LDH/GDH were incubated in the same buffer. CD spectra were measured on a CD spectrophotometer at room temperature using a quartz cuvette with a path length of 1 mm and recorded in the range 190-250 nm in steps of 0.5 nm.

Confocal Laser Scanning Microscopy (CLSM): LDH and GDH were labeled with fluorescein isothiocyanate (FITC) and rhodamine B, respectively. The distribution of both enzymes in amorphous ZIF-90 was characterized by CLSM (Olympus, FV3000).

S3: Determination of enzyme kinetic parameters

The reaction mixture of 1.2 mL containing NAD⁺, PPA, Glu and enzyme solution or NADH, PPA and enzyme solution was dissolved in 20 mM Tris-HCl buffer (pH=7). After incubation at 30 °C for 1 min, the amount of D-PLA was determined by HPLC. One enzyme activity unit (U) was defined as the amount of enzyme producing 1 μ M D-PLA per minute. Enzyme activity was measured at different substrate concentrations (PPA, 2-10 mM;) and the data were fitted to the Michaelis-Menten equation.

Table S1 LDH/GDH-ZIFs composites formed at different precursor concentrations

Sample	Concentrations of precursors	Concentrations of precursors HICA
	Zn(NO ₃) ₂ ·6H ₂ O (mM)	(mM)
1	40	160
2	40	120
3	40	80
4	40	40
5	40	20
6	30	150
7	30	120
8	30	90
9	30	60
10	30	30
11	30	15

Table S2 HPLC detection parameters

Parameters	Detecting Condition
Chromatographic Column	Hypersil ODS C ₁₈ (250 mm×4.6 mm, 5 µm)
Mobile Phase	0.1% HCOOH: CH ₃ CN=3: 1
Flow Rate	1.0 mL/min
Wavelength	210 nm
Injection Volume	20 µL
Column Temperature	40 °C

Table S3 LDH/GDH-ZIFs composites formed at different ratios of LDH: GDH

Ratio of LDH: GDH	Volume of LDH	Volume of GDH
3: 1	150	50
2: 1	133	67
1: 1	100	100
1: 2	67	133
1: 3	50	150

Table S4 Adsorption average pore width (4V/A by BET) of the LDH/GDH-ZIF-90, aZIF-90 and LDH/GDH-aZIF-90

Sample	Adsorption average pore width (4V/A by BET)
LDH/GDH-ZIF-90	2.2 nm
aZIF-90	18.1 nm
LDH/GDH-aZIF-90	22.3 nm

Table S5 Comparison with other reported LDH/GDH system

strategies	reaction condition	reaction system	specific enzyme activity (U·mg ⁻¹)	productivity (%)	reference
two-enzyme expression	pH=7, 35 °C	50 g/L PPA, 6.1 g/L Glu 50 mM	/	87.6	1
two-enzyme expression	pH=7, 42 °C	PPA, 100 mM Glu 100 mM	9.48 ± 0.91	97.83	2
two-enzyme expression	pH=5, 40 °C	PPA, 120 mM Glu, 0.1mM NAD ⁺ 10 mM	447.6	90.0	3
Two-enzyme immobilization	pH=7, 30 °C	PPA, 10 mM Glu,	1.77±0.19	99.0%±5.6%	This work

10 mM

NAD⁺

Table S6 Enzyme kinetic parameter

parameters	$K_m(\text{mM})$	$V_{\max}(\text{U}\cdot\text{mg}^{-1})$	$k_{\text{cat}}(\text{s}^{-1})$	$k_{\text{cat}}/K_m(\text{mM}^{-1}\cdot\text{s}^{-1})$
LDH	3.85	2.15	1.67	0.43
LDH-aZIF-90	4.12	2.07	1.66	0.40
LDH/GDH	4.70	2.60	2.08	0.44
LDH/GDH-aZIF-90	4.59	2.57	2.06	0.45
