Table S2 Eint (kcal/mol) values calculated for the five conformations at 315 K and 298 K

Figure S1. FTIR spectrum of GO and PNM.

FTIR spectra for PNM report the following diagnostic peaks: 3290 cm^{-1} (N-H, stretching), 2971.2 cm^{-1} (C-H, stretching), 1655.2 cm^{-1} and 1542.3 cm^{-1} (C=O stretching, amide I and II), 1378.6 cm^{-1} , (C-H, bending). FTIR peaks for GO sheets were: 3385.5 cm^{-1} (O-H stretching), 3187.1 cm^{-1} (C-H stretching, 1726.2 cm^{-1} (C=C, stretching), 1610.3 cm^{-1} (CO, stretching) and 1070.2 cm^{-1} (C=O, bending).

Photothermal measurements

Photothermal properties of GO-Au-PNM nanosystem were investigated by irradiating a glass tube (diameter 3 mm) containing various amount of GO-Au-PNM dispersion. A volume of 200 μL of GO-Au-PNM dispersion was irradiated with a CW laser 680 nm (power 500 mW and 800mW) for 10 minutes. We used the Flirck infrared thermal imaging camera to measure the temperature of solution every 10 seconds, during the heating and cooling processes. Photothermal conversion efficiency (η) of GO-Au-PNM was calculated according to equation (1) introduced by Roper¹.

$$\eta = \frac{hA (T_{max} - T_{surr}) - Q_{Dis}}{I(1 - 10^{-A})} \quad (1)$$

Where T_{max} and T_{surr} represents the max photothermal temperature and the ambient temperature respectively. The absorbance (A) at 680 nm is 0.9.

Then, equations (2) and (3) were introduced to obtain unknow hA.

$$\theta = \frac{T - T_{surr}}{T_{max} - T_{surr}} \quad (2)$$

$$\tau = \frac{M_D C_D}{hA} \quad (3)$$

where M_D and C_D are the mass of water (0.1 g) and heat capacity (4.2 J g⁻¹) of water, respectively, and τ_s is the time constant.

The time constant τ_s was calculated by the equation (4).

$$t = -\tau(\ln\theta)$$

Laser Power (W)	T max (°C)	T envir. (°C)	Time constant τ (s)	Photothermal conversion efficiency (η)
0.5	45.1	25	117.1	16 %
0.8	54.7	25	114.1	15.5 %
