General Methods and Materials

CuBr₂, CuBr, CuBr.SMe₂, CuCl₂, CuCl, CuI, Cu(OAc)₂, Cu(acac)₂, Cu(OTf)₂, CuOTf, Cu(TFA)₂, CuBr, Cs₂CO₃, NaOCH₃, KO'Bu, NaO'Bu, and LiO'Bu were purchased from Energy Chemical and used without further purification. Other chemicals were purchased from commercial suppliers, further dried and purified if necessary. The water used was re-distilled and ion-free. ¹H and ¹³C NMR spectra were achieved on a Bruker AVANCE 400 MHz spectrometer (¹H 400 MHz; ¹³C 100 MHz) in CDCl₃. Abbreviations for data quoted are *s*-singlet; *brs*-broad singlet; *d*-doublet; *t*-triplet; *dd*-doublet of doublets; *m*-multiplet. High-resolution mass spectra were measured on a Waters Micromass GCT facility. Thin-layer chromatographies were done on pre-coated silica gel 60F254 plates (Merck). Silica gel 60H (200-300 mesh) manufactured by Qingdao Haiyang Chemical Group Co. (China) was used for general chromatography.

^aReaction conditions: 1-naphthyl-1,3-indandione **1a** (0.2 mmol), styrene **2a** (0.3 mmol), catalyst (20.0 mol%), additive (30.0 mol%), solvent (3 mL), 120 °C, 24 h, reaction under air; ^b Isolated yield after chromatography; ^c Reaction carried out in 1.0 equiv of NaO'Bu; ^d Reaction carried out in the absence of CuBr₂; ^e Reaction carried out in the absence of NaO'Bu.

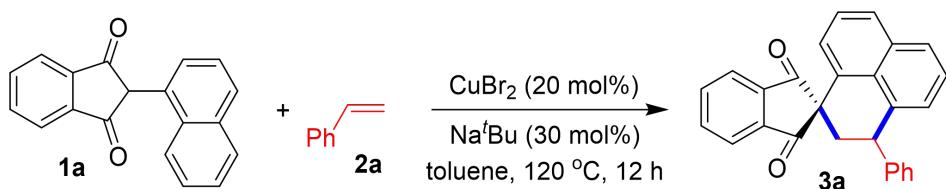

To examine the possibility of our proposed [4 + 2] cycloaddition for the formation of desired spirocyclic product **3a**, we commenced our investigations on the reaction of 1-naphthyl-1,3-indandione (**1a**) with styrene (**2a**), using CuBr (20 mol %) as the catalyst, and K₂CO₃ (30 mol %) as the base under air in toluene at 120 °C for 24 h. To our delight, the reaction proceeded smoothly and the desired cycloaddition product 3'-phenyl-2',3'-dihydrospiro[indene-2,1'-phenalene]-1,3-dione (**3a**) was observed in a 14% yield (Table 1, entry 1). Based on this finding, a variety of copper catalysts were examined, and the CuBr₂ was found to be the best choice (entries 2-11). Regarding additives (entries 12-16), NaO'Bu gave the highest yield (78%). Then, several solvents including DMSO, DMF, MeOH, THF, 1,4-dioxane, DCE, and CH₃CN were tested, and toluene proved to be the most appropriate solvent for this conversion (entries 17-23). The reaction obviously reduced yield or completely inhibited in the absence of either CuBr₂ or NaO'Bu, indicating that CuBr₂/NaO'Bu co-catalytic system was essential for the reaction outcome (entries 25-26).

General Catalytic Procedure for [4 + 2] Annulation of 1-Naphthyl-1,3-indandiones and Alkenes

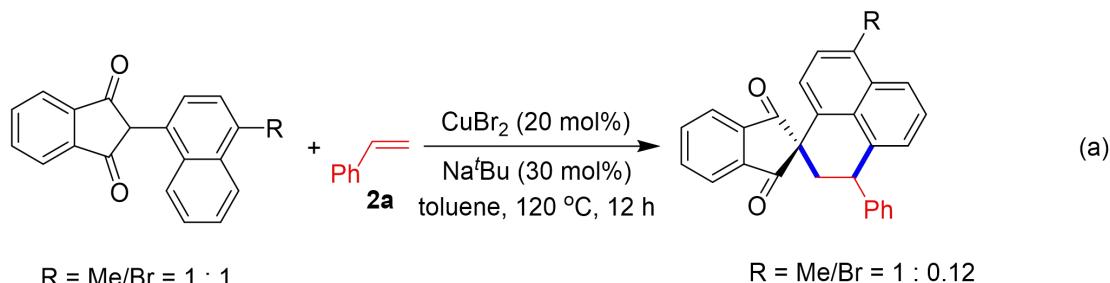

A reaction flask (25 mL) was charged with 1-naphthyl-1,3-indandione **1** (0.2 mmol, 1.0 equiv), alkene **2** (0.3 mmol, 1.5 equiv), CuBr_2 (8.9 mg, 20 mol%), NaO^tBu (5.8 mg, 30 mol%), then the toluene 3 mL was added. The mixture was stirred at 120°C in the oil bath for 12 hours under an atmosphere of air. After the reaction finished, the resulted mixtures were diluted with 20 mL of dichloromethane and washed with 20 mL of H_2O . The aqueous layer was extracted twice with dichloromethane (10 mL) and the combined organic phase was dried over Na_2SO_4 . After evaporation of the solvents, the residue was purified by silica gel chromatography (hexane/AcOEt = 20 : 1) to yield product.

Procedure Gram-scale for the Synthesis of **3a**

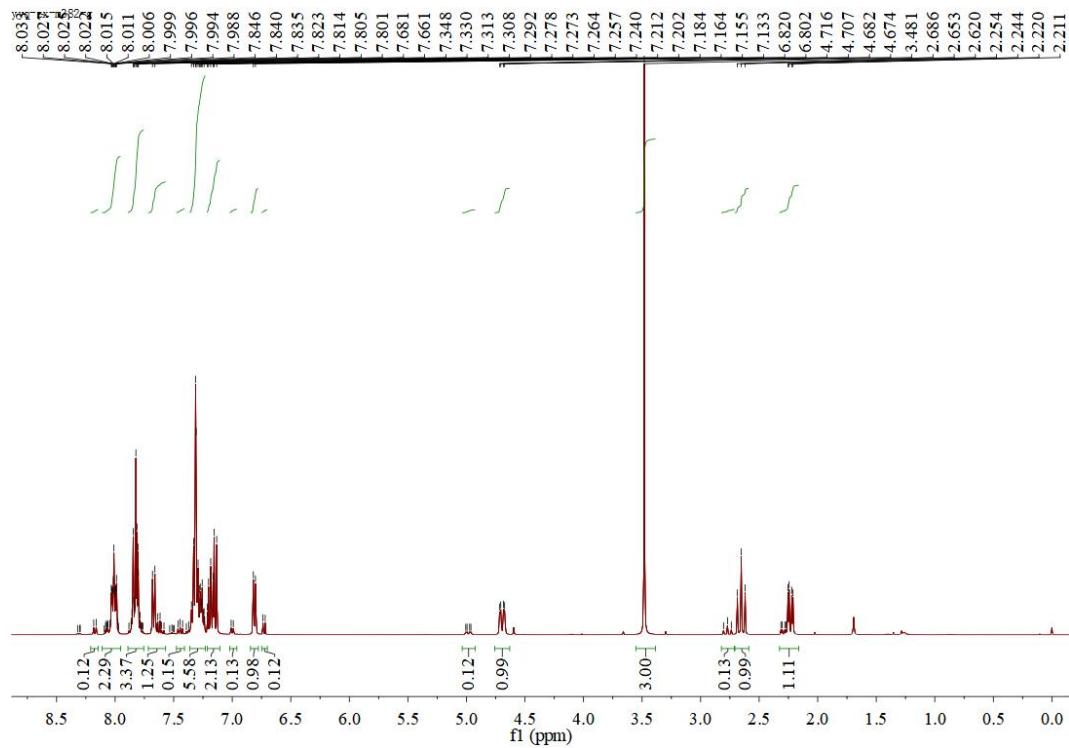

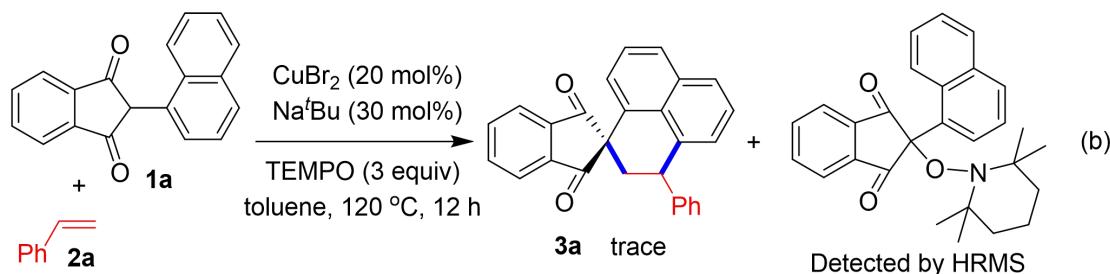

To a dry thick walled pressure resistant tube (250 mL) was charged with 1-naphthyl-1,3-indandione **1a** (5 mmol, 1.0 equiv), styrene **2a** (7.5 mmol, 1.5 equiv), CuBr₂ (223.0 mg, 20 mol%), NaO'Bu (145.0 mg, 30 mol%), then the toluene 75 mL was added. The tube was closed with a PTFE thread sealing cap. The mixture was stirred at 120 °C in oil bath for 12 hours under an atmosphere of air. After the reaction finished, the resulted mixtures were diluted with 50 mL of dichloromethane and washed with 100 mL of H₂O. The aqueous layer was extracted twice with dichloromethane (30 mL) and the combined organic phase was dried over Na₂SO₄. After evaporation of the solvents, the residue was purified by silica gel chromatography (hexane/AcOEt = 20 : 1) to yield product **3a** (61% yield, 1140.7 mg).

Mechanistic Study

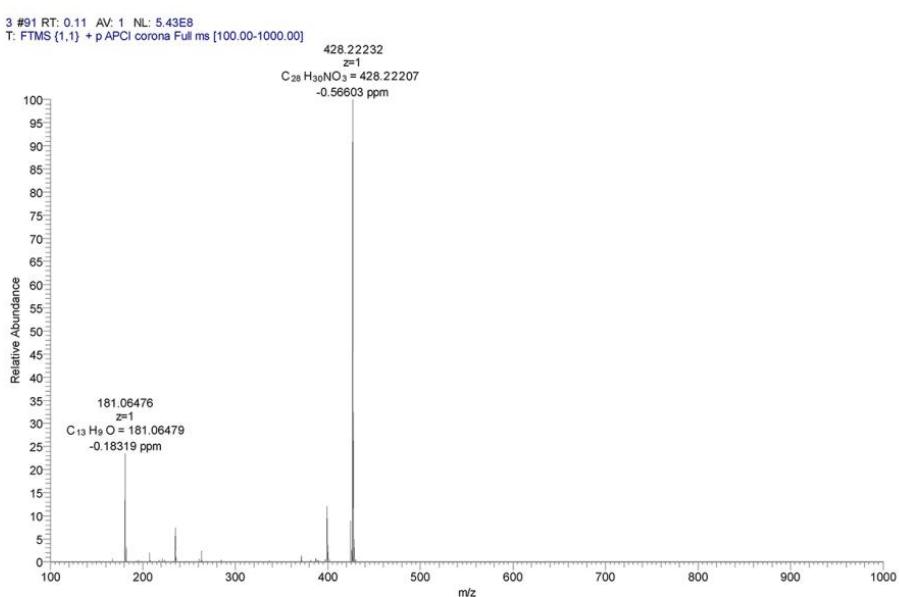

To a dry thick walled pressure resistant tube (25 mL) was charged with 2-(4-methylnaphthalen-1-yl)-1*H*-indene-1,3(2*H*)-dione (0.1 mmol, 1.0 equiv), 2-(4-bromonaphthalen-1-yl)-1*H*-indene-1,3(2*H*)-dione (0.1 mmol, 1.0 equiv), styrene (0.3 mmol, 1.5 equiv), CuBr₂ (8.9 mg, 20 mol%), NaO'Bu (5.8 mg, 30 mol%), then the toluene 3 mL was added. The mixture was stirred at 120 °C in the oil bath for 12 hours under an atmosphere of air. After the reaction finished, the resulted mixtures were diluted with 20 mL of dichloromethane and washed with 20 mL of H₂O. The aqueous layer was extracted twice with dichloromethane (10 mL) and the combined organic phase was dried over Na₂SO₄. After evaporation of the solvents, the residue was purified by silica gel chromatography (hexane/AcOEt = 20 : 1) to yield product.
