### **General methods and materials**

All chemicals in this study were purchased from chemical company. All commercial reagents and solvents were directly used without additional purification. evaporation and removal of organic solvents during the synthesis was carried out using a rotary evaporator with a diaphragm pump, and residual solvents were removed on a vacuum line held at 0.1–1 torr. TLC (thin layer chromatography) was performed on pre-coated plate with silica gel 60 F254. Visualization on TLC was achieved using UV light (254 nm). For the separation of organic compounds, the flash column chromatography was performed on silica gel (400–630 mesh) with proper organic eluents. Proton nuclear magnetic resonance spectra (<sup>1</sup>H NMR) were recorded on Bruker AVANCE 400 (400 MHz) and 500 (500 MHz). <sup>13</sup>C NMR was recorded on Bruker AVANCE 400 (100 MHz) and 500 (125 MHz) and was fully decoupled by broad band decoupling. Infrared (IR) spectra were recorded on Bruker Alpha FT-IR spectrometer. HPLC were recorded on Waters ACQUITY ultra performance Ic system with UV detector. UV–Vis absorption and photoluminescence (PL) spectra were obtained using Agilent Cary 8454 and HORIBA FluoroMax Plus spectrophotometers, respectively. The PL spectra of the solutions were measured using quartz cuvettes with a path length of 1 cm in oxygen-free solvents (20 μM in toluene, THF and MeCN). The absolute PLQYs of the solutions were measured using a FluoroMax Plus spectrophotometer (HORIBA) equipped with a 3.2-inch integrating sphere (FL-QM-sphere, HORIBA). The fluorescence decay lifetime was measured using a FluoroMax Plus spectrophotometer equipped with a DeltaTime TCSPC accessory. The data collection for single crystal structure analysis was performed on a Bruker D8 QUEST diffractometer equipped with I $\mu$ s 3.0 Mo x-ray tube ( $\lambda = 0.71073\text{\AA}$ ) and Photon II detector. The selected crystal was coated with Parabar oil for mounting on goniometer under a stream of N<sub>2</sub> (g) at 220 K. The diffraction data were integrated, scaled, and reduced by using the Bruker APEX4 software. The crystal structure was solved by SHELX structure solution program and refined by full-matrix least-squares calculations with the SHELXL.

## **General procedures for nitration, reduction, acetylation, deacetylation and esterification**

### **General procedure for nitration (Method A-1, A-2, A-3 and A-4):**

**Method A-1<sup>S1</sup>:** SBBF (5 mmol) was dissolved in conc. sulfuric acid (5 mL), and the mixture was stirred at 0 °C. Then 60% nitric acid (0.5 mL, 6.5 mmol) was slowly added to the cooled mixture solution, and the solution was continuously stirred for 2 h at 0 °C. The reaction was quenched by addition of ice, and solid were formed. The mixture was extracted with ethyl acetate (EA), organic layer was dried by treatment with MgSO<sub>4</sub>. The organic solvents were removed under reduced pressure, and the crude reaction mixture was purified by chromatography on silica gel using *n*-hexane/EA as the eluent to obtain the desired product.

**Method A-2<sup>S1</sup>:** SBBF (1 mmol) were dissolved in Ac<sub>2</sub>O (5 mL). To mixture solution was added 60% nitric acid (1 mL) at 0 °C and stirred at room temperature for 24 h. Once conversion was complete (monitored by TLC), the solution was poured into H<sub>2</sub>O (20 mL). Saturated NaHCO<sub>3</sub> solution was added to the mixture until neutral by pH paper. The organic phase was extracted with 25 mL of EA and then the organic solution was dried with MgSO<sub>4</sub>, filtered, and evaporated. The solid mixture was separated by silica gel column chromatography and the desired compound was obtained.
