

## Supplementary Information

# Are spodium bonds directional?

Velina R. Boro, Binoy K. Saha\* and Gurudosguptha Rangazhvar

### Contents

Experimental: CSD search, cone correction, distance-cone correction, computation.

Figure S1. Figures of the dimers obtained from crystal structure and from fully optimized dimer and monomer.

Table S1. Comparison of geometrical parameters among the dimer obtained from crystal structure and dimer and monomer obtained from fully optimized geometry.

Table S2. Data for % population vs  $\angle Y-Sp \cdots LB$  angle for the  $Y_4Sp \cdots LB$  interactions before cone correction.

- (a)  $Y_4Zn \cdots LB$  Interaction
- (b)  $Y_4Cd \cdots LB$  Interaction
- (c)  $Y_4Hg \cdots LB$  Interaction

Table S3. Data for % population vs  $\angle Y-Sp \cdots LB$  angle for the  $Y_4Sp \cdots LB$  interactions after cone correction.

- (a)  $Y_4Zn \cdots LB$  Interaction
- (b)  $Y_4Cd \cdots LB$  Interaction
- (c)  $Y_4Hg \cdots LB$  Interaction

Table S4. Data for % population vs  $\angle Y-Sp \cdots LB$  angle for the  $Y_5Sp \cdots LB$  interactions before cone correction.

- (a)  $Y_5Zn \cdots LB$  Interaction.
- (b)  $Y_5Cd \cdots LB$  Interaction.
- (c)  $Y_5Hg \cdots LB$  Interaction.

Table S5. Data for % population vs  $\angle Y-Sp \cdots LB$  angle for the  $Y_5Sp \cdots LB$  interactions after cone correction.

- (a)  $Y_5Zn \cdots LB$  Interaction.
- (b)  $Y_5Cd \cdots LB$  Interaction.
- (c)  $Y_5Hg \cdots LB$  Interaction.

Table S6. Data for the 3D plot of % population density at different  $Zn \cdots O$  distances and  $\angle Y-Zn \cdots O$  angles for the  $Y_5Zn \cdots O$  complexes used for distance-cone correction.

- (a) Number of hits (n) at different  $Zn \cdots O$  distance and  $\angle Y-Zn \cdots O$  angle ranges before distance-cone correction.
- (b) % of hits before distance-cone correction.
- (c) Volume of the rings (v) for different distance and angle ranges.
- (d) Distance-cone corrected population = Density of the populations for each ring = Number of hits/Volume of the rings (n/v) for different distance and angle ranges.

- (e) Distance-cone corrected % population (% of the population density of the rings for different distance and angle ranges).

Table S7. Refcodes for the cone and distance-cone corrections.

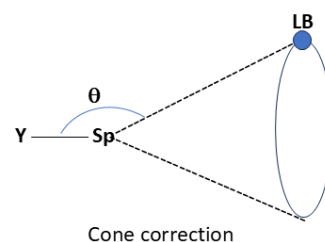

- (a) Refcodes,  $\angle Y-Zn \cdots LB$  angles and the interacting LB atoms for the cone correction of the  $CdY_5 \cdots LB$  systems.
- (b) Refcodes,  $\angle Y-Cd \cdots LB$  angles and the interacting LB atoms for the cone correction of the  $CdY_5 \cdots LB$  systems.
- (c) Refcodes,  $\angle Y-Hg \cdots LB$  angles and the interacting LB atoms for the cone correction of the  $CdY_5 \cdots LB$  systems.
- (d) Refcodes,  $\angle Y-Zn \cdots O$  angles and  $Zn \cdots O$  distances ( $d_{ZnO}$ ) for the distance-cone correction of  $ZnY_5 \cdots O$  systems.

## Experimental

**CSD search:** Statistical analyses have been performed on the spodium bonds between different Lewis bases and four- and five-coordinated spodium ions (Zn, Cd, and Hg). For the four coordinated spodium complexes, the data were taken from the work reported by Bauzá *et al.*<sup>2</sup>. The van der Waals radii for the spodium atoms were used as reported by Hu and Robertson.<sup>11</sup> The interacting LB was N, P, As, O, S, Se, Te, F, Cl, Br, I, or At.

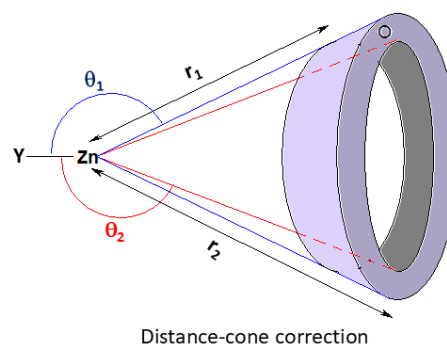

For the spodium bonds in the crystal structures of penta-coordinated spodium complexes, CSD version 5.44, April 2023, has been searched. The distance criteria used was within the van der Waals sum of the spodium atom and the interacting LB atom + 1.5 Å and the interacting LB was N, P, As, O, S, Se, Te, F, Cl, Br, I, or At, similar to the study of Gomila *et al.*<sup>9</sup> The other search criteria were 3D coordinates available, R-factor within 10%, and only single crystal data were used in the analysis. Among the five available  $\angle Y-Sp \cdots LB$  (Y is any element) angles in each interaction, the highest angle has been considered for the analysis.

**Cone correction:** There are two parameters, one is chemical and another is geometrical, that determine the probability of finding LB at a particular  $\angle Y-Sp \cdots LB$  ( $\theta$ ). As the angle  $\angle Y-Sp \cdots LB$  increases, the circle size, on which the interacting LB is residing, decreases (see the figure below). As a result, the probability of finding of LB on a circle at higher  $\theta$  decreases which is purely based on geometrical reason. Therefore, to study the chemical effect of the interaction, it is important to nullify the geometrical bias for the angle. The size of the circle is proportional to  $\sin\theta$  and hence the population distribution can be normalized with respect the angle  $\theta$  by dividing the population of LB with  $\angle Y-Sp \cdots LB = \theta$  by  $\sin\theta$ . It is done as follows.

Number of data (n) was counted for each  $\angle Y-Sp \cdots LB$  angle range of  $(155 + 10m) \pm 5$  where  $m = 0, 1, 2$  for four-coordinated systems and  $(95 + 10w) \pm 5$  where  $w = 0, 1, 2, \dots, 8$  for five-coordinated systems. The cone-corrected population is calculated as  $n/\sin(155 + 10n)$  for four-coordinated systems and  $n/\sin(95 + 10w)$  for five-coordinated systems.

**Distance-cone correction:** It is similar to the cone correction except that apart from the angle, here the distance is also taken into account. The entire space around Zn can be segmented into several rings confined within the angle and distance ranges  $\theta_1 \rightarrow \theta_2$  and  $r_1 \rightarrow r_2$  respectively. One such ring is shown in the figure below. The volume of this ring increases if the  $\theta_1$  and  $\theta_2$  angles are smaller and/or  $r_1$  and  $r_2$  distances are longer. Based on purely geometric reason, the probability of finding LB within the ring increase as the ring volume increases. Therefore, this geometric bias should be nullified to get the chemical effect of the interaction geometry. This is done by calculating the population density of LB within these rings. The procedure is shown below.

If  $N_{\theta_1\theta_2,r_1r_2}$  is the number of O atoms present within the volume of space  $V_{\theta_1\theta_2,r_1r_2}$  (shown as a ring in the above figure) around  $Zn(-Y)$ , participating in  $Y-Zn \cdots O$  interactions, the distance-cone corrected population or population density is given by

$$D_{\theta_{1\theta_2,r_1r_2}} = \frac{N_{\theta_{1\theta_2,r_1r_2}}}{V_{\theta_{1\theta_2,r_1r_2}}}$$

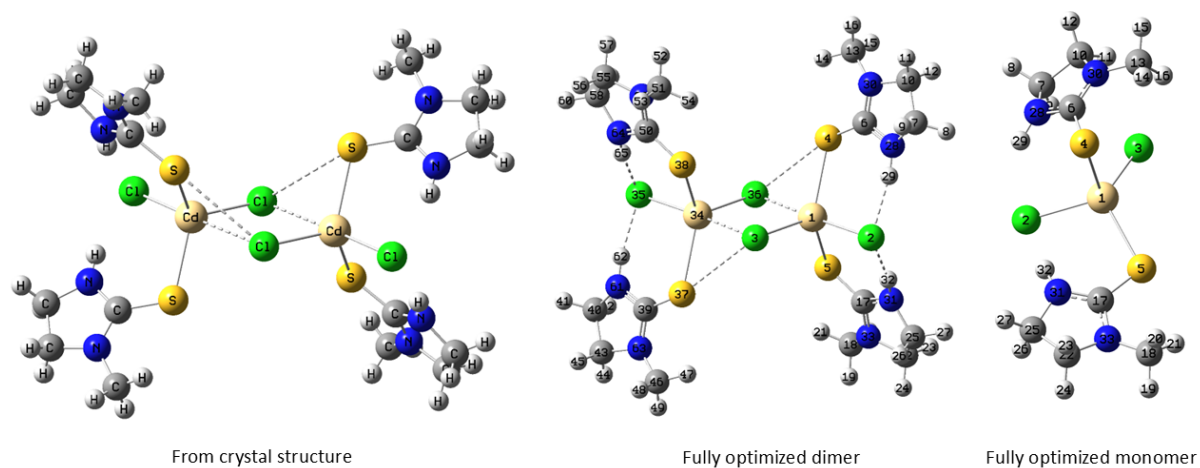

Where  $V_{\theta_{1\theta_2,r_1r_2}} = \frac{2}{3} \pi (r_2^2 - r_1^2) (\cos\theta_1 - \cos\theta_2)$  is the volume of space confined within the angle and distance ranges  $\theta_1 \rightarrow \theta_2$  and  $r_1 \rightarrow r_2$  respectively around the atom Zn.

**Compuation:** Non-hydrogen atoms frozen optimized energy, molecular electrostatic potential (MEP) surface (isoval 0.001 a.u.) and natural bond orbital (NBO) calculations were performed by using M06-2X functional with GENIECP option (basis set combination of LANL2TZ for Cd and 6-311+G(d, p) for other atoms) for the monomer of a neutral Cd coordination complex, dichloro-bis(*N*-methylimidazoline-2-thione-*S*)-cadmium(II) (refcode, HIFDFA).

For the dimer of this complex, non-hydrogen atoms frozen optimized energy calculation was performed by using M06-2X functional with GENIECP option (basis set combination of LANL2TZ for Cd and 6-311+G(d, p) for other atoms). The dimerization energy was subjected to BSSE correction using the counterpoise method. This structure was then used for single-point energy and NBO calculations by using M06-2X functional with GENIECP option (basis set combination of LANL2TZ for Cd and 6-311+G(d, p) for other atoms).

All the calculations were carried out using the Gaussian 16 program.<sup>51</sup>

**Figure S1. Figures of the dimers obtained from crystal structure and from fully optimized dimer and monomer.**

**Table S1: Comparison of geometrical parameters among the dimer obtained from crystal structure and the dimer and monomer obtained from fully optimized geometry.**

	Crystal structure	Optimized dimer <sup>a</sup>	Optimized monomer <sup>a</sup>
<b>Cd1-Cl2</b>	2.5496	2.6053	2.5345
<b>Cd1-Cl3</b>	2.4502	2.5606	2.4674
<b>Cl36...Cd1</b>	3.1559	2.7112	
<b>Cd1-S4</b>	2.5278	2.7062	2.6949
<b>Cd1-S5</b>	2.5494	2.7030	2.6309
<b>Cl36...S4</b>	3.4889	3.4574	
<b>∠S4-Cd1-S5</b>	112.477	121.119	110.238
<b>∠S4-Cd1-Cl2</b>	104.882	98.654	99.955
<b>∠S4-Cd1-Cl3</b>	117.181	116.815	101.770
<b>∠C6-S4-Cd1-S5</b>	111.437	114.155	170.082
<b>∠C17-S5-Cd1-S4</b>	85.978	115.519	80.056
<b>∠N31-C17-S5-Cd1</b>	11.802	20.880	3.485
<b>∠N28-C6-S4-Cd1</b>	2.128	19.784	69.749

<sup>a</sup> The monomer and dimer are fully optimized by using M06-2X functional with GENECP option (basis set combination of LANL2TZ for Cd and 6-311+G(d, p) for other atoms).

All the three Cd–Cl distances are more or less similar in the fully optimized dimer, indicating a coordination bond between Cl and Cd which is in contrast with the crystal structure in which two coordinated Cd–Cl bonds are significantly shorter than the third spodium Cd...Cl bond distance. In the spodium bonding, Cl3 donates electron to the  $\sigma^*$  orbital of and Cd–Cl2. As a result, the Cd–Cl3 bond length slightly decreases and the Cd–Cl2 bond length slightly increases in the dimer (crystal structure) in comparison to fully optimized monomer. This signifies some amount of charge transfer in this interaction. Geometry of the optimized monomer is very much different from that of the single unit present in the dimer in the crystal structure which signifies the importance of the spodium bond in this dimer.

**Table S2. Data for % population vs  $\angle Y-Sp...LB$  angle for the  $Y_4Sp...LB$  interactions before cone correction.**
