1. Experimental Section

1.1. Chemicals & Materials

Aqueous colloidal tin (IV) oxide solution (SnO₂, 15% in H₂O), ammonium hydroxide (NH₄OH, 28.0 ~ 30.0% NH₃) were purchased from Alfa Aesar. Lead (II) iodide (PbI₂, 99.99%) was purchased from TCI. Formamidinium iodide (FAI, > 99.99%), methylammonium chloride (MACl, > 99.99%) were purchased from greatcell solar materials. 9'-spirobifluorene (Spiro-MeOTAD, 99.8%), bis(trifluoromethane) sulfonimide lithium salt (LiTFSI, 99.8%), acetonitrile (ACN, 99.999%), 4-tert-butylpyridine (tBP, 98%), cesium chloride (CsCl, 99.99%), N,N-dimethylformamide (DMF, 99.8%), dimethyl sulfoxide (DMSO, 99.9%), diethyl ether (99.7%), chlorobenzene (CB, anhydrous 99.8%), and ¹²C-citric acid (\geq 99.5%) were purchased from Sigma-Aldrich. ¹⁴C-citric acid (1,5-14C, 50-60 mCi mmol⁻¹, EtOH: D.I water = 1 : 9) was purchased from American Radiolabeled Chemicals Inc. Ethyl alcohol (Anhydrous, 99.9%) was purchased from Daejung Chemicals & Metals Co., LTD. Carbon paste was purchased from KLK. Carbon powder was purchased from Xiamen TOB New Energy Technology Co., Ltd. All chemicals are used directly without further purification.

1.2. Preparation of the α -phase FAPbI₃ perovskite films

The fluorine-doped tin oxide (FTO) glass substrates (TEC-7, 7 Ω sq⁻¹) were cleaned with detergent, deionized water, ethanol, and isopropanol by sonication 10 min each. The cleaned FTO substrate was further treated with ultraviolet–ozone (UVO) for 30 min. A SnO₂ thin layer was deposited on the FTO substrate by spin coating the SnO₂ precursor solution (the stock solution was diluted with deionized water ratio 1:4 v/v%) at 4000 rpm for 30 s, which was annealed at 185 °C for 30 min at ambient atmosphere. The 1M solution was prepared by dissolving 706 mg of the synthesized FAPbI3 single crystal in 595.5 uL of N,Ndimethylformamide (DMF, 99.8%) and 79.4 uL of Dimethyl sulfoxide (DMSO 99.9%). For additive engineering, MACl, and dual additive of MACl and CsCl were added in the perovskite precursor, where 20 mol% (14.4mg) of MACl was added for the single additive device. For dual additive, 20 mol% (14.4 mg) of MACl and 10 mol% (9 mg) of CsCl for (MACl):(CsCl) = 4:1 was added in the perovskite precursor solution. The precursor solutions were stirred overnight at room temperature which was filtered by PTFE filter (0.2 µm pore size) before use. The SnO₂-coated FTO substrate was once again treated with UVO for 30 min prior to the deposition of perovskite precursor. The 50 µL of perovskite precursor solution was spread on the SnO₂-coated FTO substrate and rotate at first 1000 rpm for 10 sec and second 4000 rpm for 20 s. While spinning, 1 mL of diethyl ether was dripped on the rotating substrate 5 s before spin coating has finished. The films were annealed for 10 min at 150 °C, on which a spiro-MeOTAD (2,2',7,7'-tetrakis(N,N-di-4-ethoxyphenylamino)-9,9'-spirobifluorene) layer was spin-coated at 4000 rpm for 30 s using the solution of 40.45 mg of spiro-MeOTAD, 19.5 µL of 4-tert-butylpyridine and 11.5 µL of lithium bis(trifluoromethylsulphonyl)imide (540 mg dissolved in 1 mL of acetonitrile) in 500 mL chlorobenzene. While spinning, 20µL of Spiro-MeOTAD solution was dripped on the rotating substrate 10 s after spin coating had started.

1.3. Preparation of the radioactive carbon nanoparticles/quantum dots (¹⁴CNP/CQD)

The carbon nanoparticles and quantum dots were synthesized using the similar pyrolysis method as in the previous report. The carbon layer was coated on the FTO glass substrate by a doctor-bladed technique. Afterwards, the electrode was sintered at 200 °C for 2 h on a hot plate, and then the impurities were blown out by the nitrogen gas. To prepare the ¹⁴CNP/CQD, 1 mL of ammonia solution was mixed with 10 mL of the ¹⁴CA solution. Then 50

 μ L of precursor solution was poured dropwise on the carbon electrode with drying at 100 °C. After drying, the sample was sintered in a box furnace at 200 °C for 3 h, at a rate of 10 °C min⁻¹. The method for producing ¹²CNP/CQD follows the same procedure as that used for ¹⁴CNP/CQD, with the only difference being the substitution of the ¹²CA solution for the ¹⁴CA solution. the ¹²CA solution comprised 4 mg ¹²C-citric acid, 9 mL D.I. water, and 1 mL ethyl alcohol. The mixed solution has the same concentration as the radioactive isotope citric acid (¹⁴C-citric acid, EtOH: D.I. water = 1: 9).

1.4. Assembly of a perovskite betavoltaic cell (PBC)

The carbon counter electrode was coated with carbon powder, and the perovskite working electrode was carefully pressed to match its dimensions. Subsequently, the electrodes were securely coupled by utilizing Teflon tape under tension.

1.5. Material Characterizations and Device Measurements

The surface, cross-sectional morphologies, and thickness of electrodes were analyzed at 3 kV and 10 μ A using a field emission scanning electron microscope (FESEM, SU 8020, Hitachi). A transmission electron microscope (TEM, HF 3300, Hitachi,) was used to confirm the size and lattice spacing of the carbon quantum dots. The optoelectronic properties were measured by a UV-Visible spectrophotometer (UV-vis, Cary series, Agilent), photoluminescence (PL, FluoroMax Plus, Horiba). To obtain the phase and chemcial properties, a X-ray diffraction (XRD, Miniflex 600, Rigaku) was used along with a Panalytical, Empyrean X-ray diffractometer using Cu K λ radiation ($\lambda = 1.54$ Å). Raman spectra of the carbon nanoparticles/quantum dots were obtained using a Raman spectrometer (Nicolet Almeca XR, Thermo Scientific) with a 532 nm laser for excitation. To confirm the performance of photovoltaics and betavoltaics, a solar simulator (LCS-100, Oriel Sol), a potentiostat (Multi Autoalab, Metrohm), and a source meter (Keithley, 2635B, Keithley Instruments Inc.) was used. Based on the values obtained by source meter and potentiostat, the ECE and increase in the number of mobile electrons were calculated (**Equations S1-S3**).

Equation S1. Calculations for the energy conversion efficiency of betavoltaic cell.^{1–3}

$$\eta = \frac{P_{max}}{P_{source}} \times 100\% = \frac{J_{sc} \times V_{oc} \times FF}{E_{avg} \times e \times A} \times 100\%$$
(Eqn. 1)

 P_{max} : The maximum output power of the betavoltaic device (W)

 P_{source} : The radiation power of the isotope carbon source (W)

FF: Fill factor

Voc: Open-circuit voltage (V)

 J_{sc} : Short-circuit current density (A cm⁻²)

A: Isotope carbon source per active surface area (mCi cm⁻²)

 $= 0.0045 \text{ mCi} / 1.0 \text{ cm}^2 = 0.0045 \text{ mCi} \text{ cm}^{-2}$

 $1 \text{ Ci} = 3.7 \times 10^{10} \text{ Bq} = 3.7 \times 10^{10} \text{ Decay/s}$

 E_{avg} : The average beta energy of the isotope (eV/Decay) = 49.4 keV/Decay for radioactive isotope of carbon

e: Electron charge (C)

Putting values in Eqn. 1

 $=\frac{15.010 \, nA/cm^2 \times 2.750 \, mV \times 0.584}{(49.4 \, keV/Decay)(1.6 \times 10^{-19} \, C)(0.0045 \, mCi/cm^2)} \times 100\%$

$$=\frac{15.010 nA \times 2.750 mV \times 0.584 \times (\frac{e}{1.6 \times 10^{-19} C}) \times (\frac{1.6 \times 10^{-19} C}{e})}{(1.665 \times 10^5 Decay/s) \times (7.904 \times 10^{-15} J/Decay)} \times 100\%$$
$$=\frac{(9.381 \times 10^{10} electron/s) \times (2.570 \times 10^{-22} J/electron)}{(1.665 \times 10^{-19} C)} \times 100\%$$

 $= \frac{100\%}{(1.665 \times 10^5 \ electron/s) \times (7.904 \times 10^{-15} \ J/electron)} \times 100\%$

$$=\frac{0.0241 \, nW}{1.316 \, nW} \times 100\% \cong 1.83\%$$

∴ Energy conversion efficiency of PBC: 1.83%.

Equation S2. Calculations for the increase in mobile electrons.¹

 $\frac{Number of electrons from PBC per second}{Number of electrons emitted from source per second} = \frac{I_{sc}}{\emptyset}$ (Eqn. 2)

Isc: Short-circuit current (A)

 \emptyset : The isotope carbon source activity (mCi) = 0.0045 mCi

 $1 \ Ci = 3.7 \times 10^{10} \ Bq = 3.7 \times 10^{10} \ Decay/s$

Putting values in Eqn. 2

$$= \frac{15.010 \, nA}{(3.7 \times 10^7 Bq/mCi)(1Decay/Bq \cdot s)(0.0045 \, mCi)}$$

$$= \frac{15.010 \, nA \times (\frac{e}{1.6 \times 10^{-19} \, C})}{(3.7 \times 10^7 Bq/mCi)(1Decay/Bq \cdot s)(0.0045 \, mCi)(1 \, electron/Decay)}$$

$$= \frac{9.381 \times 10^{10} electron/s}{1.665 \times 10^5 electron/s}$$

$$= 5634 \times 10^5 \cong 5.6 \times 10^5$$

: Generated 5.6 × 10⁵ times more mobile electrons than generated by β -radiation only.

Equation S3. Calculations for energy generated from the radioactive isotope (¹⁴C).¹

Radioactive isotope carbon's average energy: 49.4 keV

P(0): Power emitted by the isotope at time (t = 0) from the radioactive source (W/Ci)

E(0): Energy emitted by the isotope at time (t = 0) from the radioactive source (J/s)

$$P(0) = Average energy (keV/Decay) \times 3.7 \times 10^{10} (Decay/s \cdot Ci) \times 1000 (eV/keV) \times 10^{-19} (J/eV)$$

 $= 292.448 \, \mu W/Ci$

 $E(0) = P(0) \times 0.0045 \ mCi = 1.316 \ \times 10^{-9} \ J/s = 1.316 \ nW$

∴ Energy generated from radioactive isotopes: 1.316 nW (using 0.0045 mCi).

This energy is 1.316×10^{-10} times lower than the light energy on the active surface area of

1.0 cm² (1000 W/m² × 1.00 cm² = 0.1 W).

	Article							
NUCLEAR SAFETY ACT	Article 2 (Definitions)							
	The terms used in this Act shall be defined as follows:< Amended by Act No. 11715, Mar.23, 2013; Act No. 12666, May 21, 2014; Act							
	No. 13078, Jan. 20, 2015; Act No. 1338, Jun. 22, 2015; Act No. 13616, Dec. 22, 2015>							
	3. The term "nuclear fuel materials" means materials prescribed by Presidential Decree that produce nuclear energy, such as uranium as							
	thorium;							
	4. The term "nuclear raw materials	" means uranium ore, thorium ore	e, and other materials prescribed b	y Presidential Decree, used as ray				
	materials for nuclear fuel materials;							
	6. The term "radioactive isotope" means an isotope which emits radiation and what is prescribed by Presidential Decree among an combination thereof:							
ENFORCEMENT DECREE OF	Article 5 (Radioisotopes)							
THE NUCLEAR SAFETY ACT	"Isotope prescribed by Presidential Decree" in subparagraph 6 of Article 2 of the Act means any substance for which the quantity and							
	concentration of an isotope exceed such quantity and concentration as determined by the Commission, excluding the following substance							
	1. Nuclear fuel material referred to in subparagraph 3 of Article 2 of the Act;							
	2. Nuclear source material referred to in subparagraph 4 of Article 2 of the Act;							
	3. Radioactive material or apparatuses in which radioactive material is embedded, which poses no risk of radiation hazard as determined							
	and publicly notified by the Commission.							
STANDARD OF RADIATION	Article 9 (Quantity and Concent							
PROTECTION	"Quantity and concentration as prescribed by the Nuclear Safety and Security Commission" as provided for in Article 5 of the Decree sha							
	be the quantity in column 3 and the concentration in column 4 for the relevant radionuclides in column 2 of Table 5.							
	Quantity and Specific Activity of Radioisotopes for Exemption [Table 5]							
				Minimum Specific Activity				
	Atomic number	Isotopes	Minimum Quantity, (Bq)	(Bq/g)				
	[Column 1]	[Column 2]	[Column 3]	[Column 4]
