## SUPPORTING INFORMATION

### Future Experimental Verification of C<sub>10</sub>H<sub>8</sub> Isomer Diversity

The models presented here predict the formation of multiple C<sub>10</sub>H<sub>8</sub> isomers in addition to naphthalene, and this provides a target for experiments to detect their presence in the Bittner-Howard reaction. The authors have performed mass spectrometric experiments of the reaction at the Chemical Dynamics Beamline at the Advanced Light Source in Berkeley, California near the low temperature and pressure limits of this study, using the methods described in [44]. These experiments are to be the subject of a future publication on the Bittner-Howard reaction. Unfortunately, the experiments were unable to conclusively verify the presence of multiple C<sub>10</sub>H<sub>8</sub> isomers, which is believed to be for two main reasons. Firstly, the achievable limits of pressure and temperature imposed by the apparatus are at the very low end of the model, at 4 Torr and 550-700 K. This region of the model is one of the few that predicts very little C<sub>10</sub>H<sub>8</sub> isomerism, with the vast majority of the branching ratio attributed to naphthalene.

Secondly, unlike azulene [26], the ionisation energies of the most common predicted C<sub>10</sub>H<sub>8</sub> isomers are very similar to that of naphthalene, as presented in Table S1. The resolution of the instrument combined with the gradual onset of ionisation as energy increases prevents conclusive assignment of the C<sub>10</sub>H<sub>8</sub> signal. Future experiments with greater precision in detecting the ionisation energy of these reaction products, such as PEPICO, will be vital in verifying or refuting the model presented in this study.

**Table S1.** CBS-QB3 adiabatic ionisation energies for the five significant C<sub>10</sub>H<sub>8</sub> species predicted by the model.

Species	Adiabatic Ionisation Energy (eV)
BZFV	8.11
NAPH	8.17
E-EPE	8.21
PVAC	8.22
Z-EPE	8.26

**Table S2.** M06-2X and G3X-K energies for all intermediates, products and transition states included in the model. Labels for each stationary point are as listed in Figure 2. All energies are in kcal/mol, with the Z- $\beta$ -styryl radical (Z- $\beta$ S) chosen as the reference energy.

\* this step has a submerged barrier with G3X-K energies, though not with M06-2X energies. No post-reactive complex was locatable, so t103 was treated as a zero-height barrier from the isolated products (-40.07 kcal/mol). This approximation was deemed sufficient as the flux across t103 was low.

**Table S3.** Branching ratios for all 48 species under all 30 sets of temperature and pressure conditions. *trans*, *cis* and the weighted average of these are each listed.
