## FT-IR spectra details

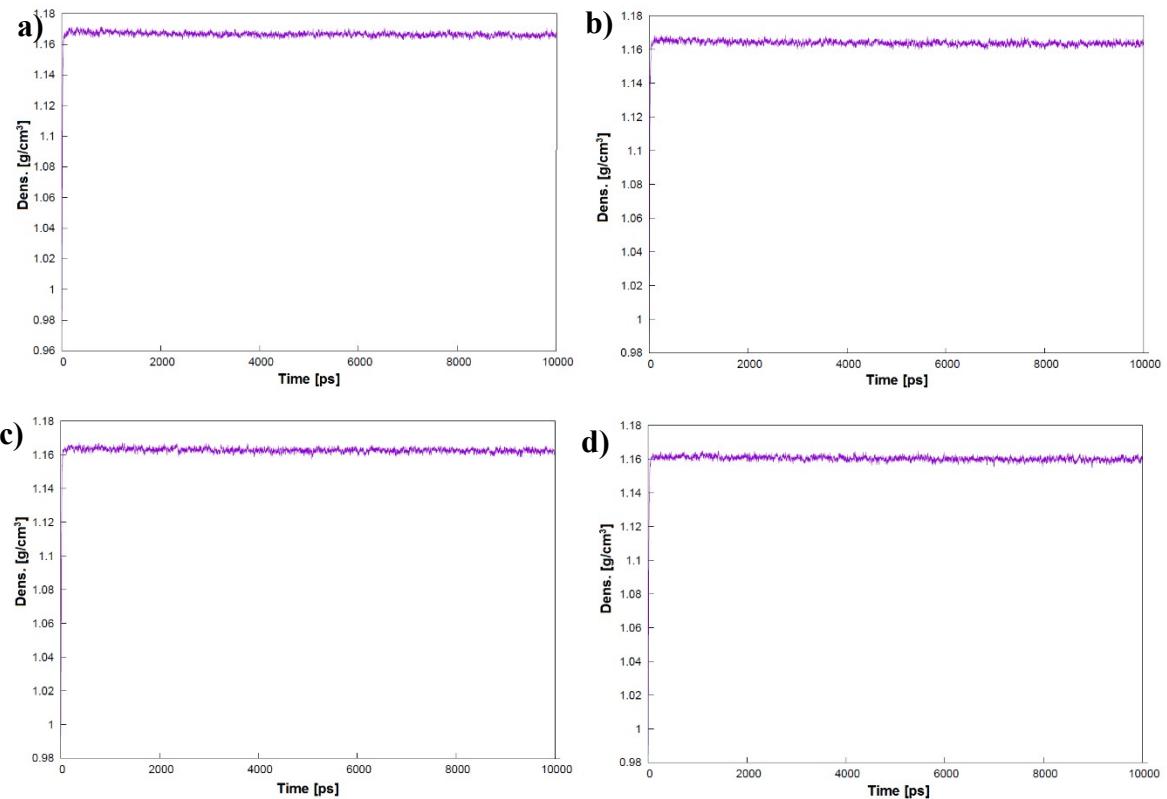

Figure S4 shows a series of Fourier-transform infrared (FTIR) spectra for selected  $\text{Bi}_4\text{O}_5\text{Br}_2$  and  $\text{BiOBr}$  materials. The spectra of  $\text{Bi}_4\text{O}_5\text{Br}_2$  KBr\_gly and  $\text{Bi}_4\text{O}_5\text{Br}_2$  C16\_gly exhibit peaks at  $525 \text{ cm}^{-1}$ ,  $1400 \text{ cm}^{-1}$ ,  $2850 \text{ cm}^{-1}$  and  $1630 \text{ cm}^{-1}$ ,  $3450 \text{ cm}^{-1}$ , which originating from Bi-O stretching vibrations, vibrations of C-H groups from adsorbed from air organic species, and surface-adsorbed water, respectively. The FTIR spectra of  $\text{BiOBr}$  samples had the same signals as those for  $\text{Bi}_4\text{O}_5\text{Br}_2$  spectra.

## Molecular dynamics calculation details

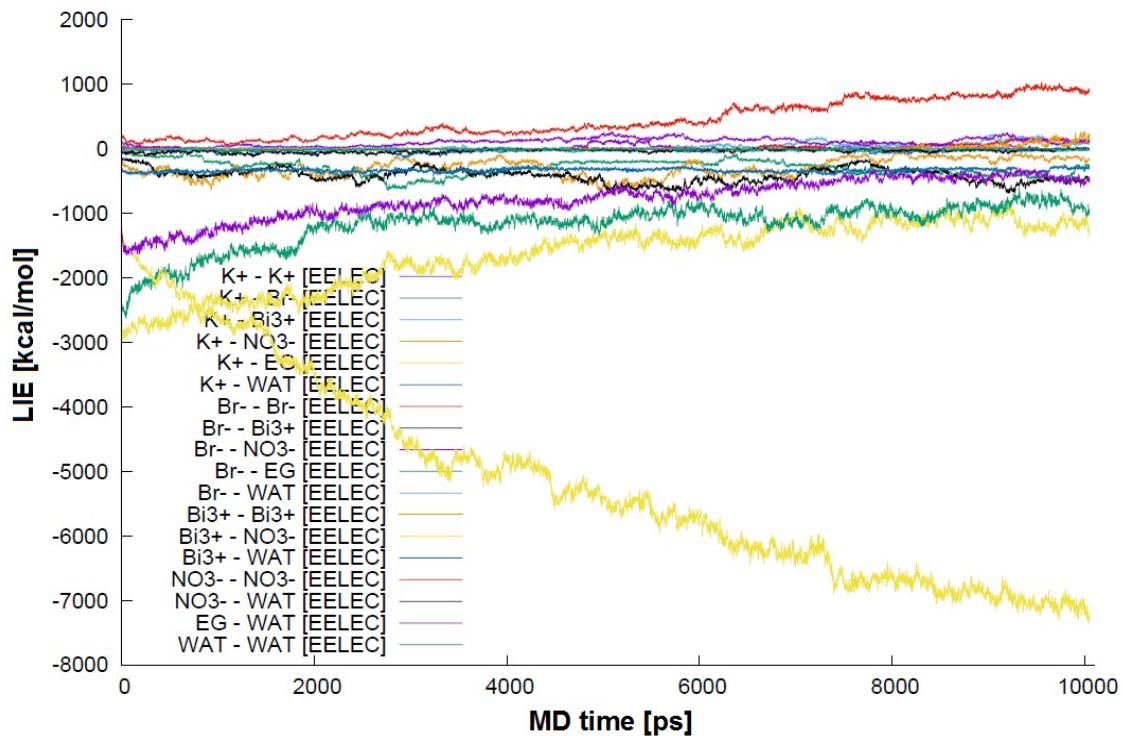

MD simulation sets were initially adjusting itself by changing their density through initial 50 ps of MD and then stabilized at constant levels of density. For the last 1 ns of each MD the resulting medium densities were  $1.164 \text{ g/cm}^3$ ,  $1.162 \text{ g/cm}^3$ ,  $1.160 \text{ g/cm}^3$  and  $1.166 \text{ g/cm}^3$  for C4M (C4mimBr), C8M (C8mimBr), C16M (C16mimBr) and POT (KBr) sets, respectively. Binding free energies and number of identified hydrogen bonds stabilized after 8 ns of MD, therefore for conclusive hydrogen bond analysis only last 1 ns of MD was considered. The total numbers of identified hydrogen bonds throughout last 1 ns of MD simulation was presented in Figure S5. The data plot lines were approximated with a Bézier curve to clearly expose the trends and their relative values.

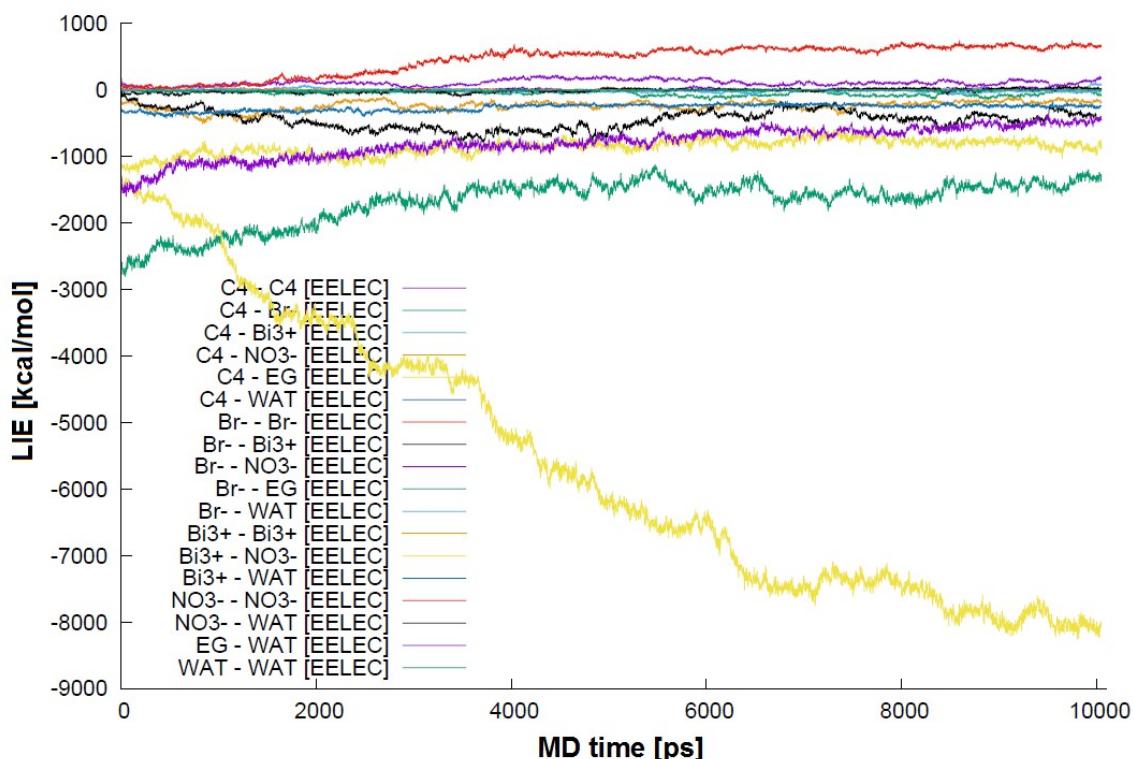

**Figure S5.** Averaged number of hydrogen bonds in last 1 ns of MD simulation.
