## 26 **Supplementary material**

### 27 **A. European legislation on municipal sewage sludge management**

28 To establish more sustainable municipal sewage sludge (MSS) management practices, extensive  
29 legislation was produced by the European Commission. MSS is classified as a “non-hazardous” solid  
30 waste <sup>1</sup>. Several directives from the European Union such as the Water Framework Directive <sup>2</sup> and  
31 the Waste Framework Directive <sup>3</sup> influence MSS management by establishing a hierarchical approach  
32 foreseeing waste prevention (*e.g.* minimization techniques), preparation for reuse (*e.g.* chemical or  
33 biological stabilization), recycling (*e.g.* material recovery), other recovery (*e.g.* energy recovery), and  
34 disposal (*e.g.* landfilling) <sup>4</sup>.

35 The implementation of the Council Directive 91/271/EEC <sup>5</sup> concerning urban wastewater treatment,  
36 also known as “Urban Waste Water Treatment Directive” (UWWTD), has affected the increase in  
37 the amount of generated MSS. However, the Directive encourages the valorization of MSS whenever  
38 appropriate and regulates its use in order to minimize hazardous effects on the environment; thus, it

39 was determinant for adapting to other disposal and treatment methods beyond the landfill.  
40 Subsequently, the Council Directive 91/676/EEC <sup>6</sup>, concerning water protection against pollution  
41 caused by nitrates from agricultural sources, resulted in a reduction of areas on which MSS can be  
42 used for agricultural purposes. Council Directive 1999/31/EEC <sup>7</sup> introduced stringent new standards  
43 related to landfilling of biodegradable waste, while Directive 2018/850 <sup>8</sup> amended the former by  
44 extending such limitations to “*waste that is suitable for recycling or other recovery*”, therefore  
45 including MSS.

46 Generally, MSS recovery methods can be categorized under two different management routes: an  
47 organic recycling route (including agricultural spreading and composting) and a route focused on the  
48 recovery of energy and materials (including thermochemical conversion methods) <sup>9</sup>. In order to align  
49 the Directive with the ambitions reported in the European Green Deal and the Zero Pollution Action  
50 Plan, the European Commission opened in 2020 a public consultation for the revision of the UWWTD  
51 <sup>10</sup>, including new circular approaches to MSS management for the recovery of nutrients, materials  
52 and energy, as well as the importance of MSS usage as fertilizer.

53 The most meaningful document concerning the organic recycling route is the Council Directive  
54 1986/278/EEC <sup>11</sup>, also known as “Sewage Sludge Directive” (SSD), which is aimed at regulating the  
55 use of MSS in agriculture. On the other hand, toxic organic and inorganic pollutants contained within  
56 MSS could be highly dangerous if dispersed in the environment because of their persistence and  
57 possible toxicity to people and wildlife <sup>12-16</sup>. By defining specific limits on potentially toxic elements  
58 (PTEs) concentration both in treated MSS and soils on which MSS is distributed, the SSD aimed at  
59 preventing harmful effects on soil, vegetation, animals and humans. To this end, it also prohibits the  
60 use of untreated MSS on agricultural land unless it is injected or incorporated into the soil. The SSD  
61 did not introduce limits on organic pollutants concentration nor on the presence of pathogens in soils.  
62 Therefore, to mitigate the environmental risks associated with the agricultural reuse of MSS, many  
63 EU Member States have established their own legislation to regulate these substances within MSS  
64 and/or soils, further setting more stringent limits for PTEs <sup>17</sup>. Lately, in light of the most recent  
65 environmental strategies and planning tools such as the New Circular Economy Action Plan <sup>18</sup>, the  
66 European Green Deal <sup>19</sup>, the Bioeconomy Strategy <sup>20</sup>, the Farm to Fork Strategy <sup>21</sup>, the EU  
67 Biodiversity Strategy for 2030 <sup>22</sup>, and the post-Covid-19 recovery plan for Europe <sup>23</sup>, the Directive  
68 has gained additional significance and a process of revision is currently ongoing <sup>24</sup>, in order to exploit  
69 the potential of MSS in the context of the circular economy transition, in order to contribute to  
70 increasing resource efficiency and protect human health. A first result of this revision process has  
71 been the new Regulation 2019/1009 <sup>25</sup> on the market of fertilizing products, introducing for the first

72 time organic and, in particular, bio-based and recovered fertilizers beyond mineral/inorganic ones as  
73 fertilizing products, aiming to harmonize their production and composition. Due to their  
74 micropollutant content, “pyrolysis and gasification materials” (including biochar) derived from MSS  
75 have been excluded from the EU fertilizing products <sup>26</sup>.

76 Regarding the material recycling route, many valuable raw materials can be recovered from MSS:  
77 water, compost, nutrients, agronomic additives, sulfur, phosphorous salts, fibers, proteins, biomass,  
78 up to more complex materials such as biopolymers <sup>27–32</sup>. However, in accordance with the Waste  
79 Framework Directive, most of these materials are classified as waste when obtained from MSS.  
80 Nevertheless, the new Fertilising Products Regulation <sup>25</sup>, applied from July 2022, already defined  
81 conditions to obtain an “End-of-Waste” status for struvite and ash-based products from MSS. In order  
82 to develop a real market for such secondary materials, additional criteria should be proposed and  
83 discussed at the EU level in the near future.

84 Finally, concerning the energy recovery route, the EU aims to the following main waste-to-energy  
85 processes: incineration, AD, production of waste-derived solid, liquid or gaseous fuels, and other  
86 thermal treatments such as pyrolysis or gasification <sup>33</sup>. With this scope, Directive 2009/28/EC <sup>34</sup>  
87 (subsequently modified to the currently in-force Directive 2018/2001 <sup>35</sup>) promoted the use of energy  
88 from renewable sources, recognizing energy derived from biomass, landfills, and WWTP as a  
89 renewable energy source.
