Data expressed as mean±standard deviations. The levels of complete blood count and serum biochemistry were analyzed among three groups at baseline and the end of intervention using one-way analysis of variance or the Kruskal–Wallis H-test, and the Benjamin–Krieger–Yekutieli method was used to adjust P values for pairwise comparisons. Self-comparisons within the groups before and after the intervention were carried out. * represent $P < 0.05$, ** represent $P < 0.01$, *** represent $P < 0.001$.
