Experimental Section

General Information

All anhydrous reactions were carried out by standard procedures under nitrogen atmosphere to avoid moisture. The solvents were dried by distillation over appropriate drying agents. Reactions were monitored by TLC plates and column chromatography was generally performed on silica gel. 1H and ^{13}C NMR were recorded on a 400 MHz spectrometer. Photophysical properties, including absorption and emission spectra, were recorded using a SHIMADZU (UV-1900i) spectrophotometer and Hitachi F-2700 spectrofluorometer, respectively. Chemicals, reagents and solvents used in this study were obtained from local vendors and employed in their received condition without any additional purification steps. Particularly, starting materials such as cholic acid, hydrazine, 1-bromohexane and phenothiazine were acquired from Sigma Aldrich. DMSO, $POCl_3$, THF, NaOH and other chemical reagents were obtained from SRL Chemicals. The metal ion recognition property of ChHSB-PTZ was explored by spectrofluorometer upon the addition of analytical grade metal salts $Cu(OAc)_2$, $CuCl_2$, $Cu(ClO_4)_2$, $CuSO_4 \cdot 5H_2O$, $Cu(NO_3)_2 \cdot 3H_2O$, $Ni(NO_3)_2 \cdot 6H_2O$, $Pb(NO_3)_2$, $Co(NO_3)_2 \cdot 6H_2O$, $Hg(NO_3)_2 \cdot H_2O$, $Fe(NO_3)_2 \cdot 9H_2O$, $Zn(NO_3)_2 \cdot 6H_2O$, $Fe(NO_3)_3 \cdot 9H_2O$, $AgNO_3$, $Ca(NO_3)_2 \cdot 4H_2O$, $Mg(NO_3)_2 \cdot 6H_2O$, $SnCl_2 \cdot 2H_2O$ for cation and sodium salt NaCl, NaF, NaSCN, $Na_2Cr_2O_7 \cdot 2H_2O$, Na_2CrO_4 , Na_3PO_4 , Na_2HPO_4 , NaH_2PO_4 , NaBr, NaI, $NaNO_3$ used as anion from local vendors. Deionized water used in all spectroscopic investigations was obtained from a Milli-Q reference water purification system by Thermo-Scientific, which

ensures precise resistivity. A stock solution of ChHSB-PTZ (10^{-3} M) was prepared in THF. Similarly, stock solutions for cations and anions (10^{-4} M) were carefully prepared in deionized water, specifically for evaluation of optical properties.

Synthesis of Phenothiazine Carbaldehyde (PTZ-CHO):

Scheme S1: Synthesis of ChHSB-PTZ

1-2 Synthesis of PTZ-CHO: To a combination of phenothiazine (2.5 g, 12.5 mmol) and $\text{C}_6\text{H}_{13}\text{Br}$ (1.93 ml, 13.9 mmol) in 50 mL DMSO, NaOH (0.85 g, 21.32 mmol) was added under cooling condition. Then, the resultant blend was stirred at RT for 24 hours after which 200 mL of H_2O was mixed. The resultant mix was extracted using CHCl_3 (3x50 mL) and water. Then, the organic layer was washed with a saturated brine solution and then dried using anhydrous Na_2SO_4 to remove any

trace of moisture. After evaporating the solvent, the mixture was purified via column chromatography, in which n-hexane was used as the solvent on silica gel. Finally, white oily liquid (Compound 1, yield 86 %) was obtained. After obtaining a 10-hexyl-10H-phenothiazine which is the alkylated form of phenothiazine, PTZ-CHO was synthesized. For the synthesis of PTZ-CHO, POCl₃ (2.64 mL, 28.2 mmol) was added dropwise to an ice cooled RB flask comprising DMF (12 mL). The combination was stirred at 0 °C for 1 hour and then, compound 1 (1.78 gm, 6.2 mmol) was added to it. Finally, the reaction mix was exposed to a temperature of 80 °C for 16 h. After that, the crude product was poured into ice-water. Then, saturated aqueous K₂CO₃ was added to the mixture and extracted with chloroform (4x30 mL). Eventually, moisture was removed using MgSO₄. Finally, the solvent was removed using rotatory evaporator, and the crude product was purified using column chromatography [Hexane/EtOAc (8:2) as eluent]. Thus, a pale-yellow solid is obtained (yield 94%).

The fluorescence quantum yields: The fluorescence quantum yields for the ChHSB-PTZ were calculated using Fluorescein as the standard by using the steady-state comparative method:

$$\Phi_f = \Phi_{ST} * \frac{S_U}{S_{ST}} * \frac{A_{ST}}{A_U} * \frac{\eta_{Du}^2}{\eta_{ST}^2}$$

Equation S1: Quantum yield formula

Where, Φ_f is the emission quantum yield of the sample, Φ_{ST} is the emission quantum yield of the standard, and A_{ST} and A_U represent the absorbance of the standard and the sample at the excitation wavelength, respectively. S_{ST} and S_U are the integrated emission band areas of the standard and

the sample, respectively and η_{ST} and η_{Du} are the solvent refractive indices of the standard and the sample.

Optical Band Gap:

$$E_g = \frac{1240}{\lambda_{onset}}$$

Equation S2: Optical Band Gap formula
