## 1 **Experimental Procedure for UV-Visible Absorption Spectroscopy**

2 1 mg of PTPAS solid was added into separate glass vials, and then 20 mL of different  
3 polar solvents (HEX, TCM, EA, DCM, THF, DMF, EtOH, and MeOH) were added.  
4 After complete dissolution, absorption spectra were measured by using a UV-Visible  
5 spectrophotometer .

## 6 **Experimental Procedure for Fluorescence Testing**

7 1 mg of PTPAS solid was added into separate glass vials, and then 20 mL of different  
8 polar solvents (HEX, TCM, EA, DCM, THF, DMF, EtOH, and MeOH) were added.  
9 After complete dissolution, fluorescence spectra testing were performed under  
10 excitation at the maximum absorption wavelength.

## 11 **Experimental Procedure for Fluorescence Quantum Yield ( $\phi_F$ )**

12 A PTPAS solution with an absorbance of less than 0.05 at an absorption wavelength  
13 of 360 nm was prepared, and quinine sulfate solution ( $\phi_F = 0.54$ , solvent: 1.0 N H<sub>2</sub>SO<sub>4</sub>  
14 aqueous solution) was utilized as a reference sample [1, 2]. The fluorescence spectrum  
15 of PTPAS was measured by using a fluorescence spectrometer. The fluorescence  
16 quantum yield ( $\phi_F$ ) was calculated by using Equation S1 based on the obtained test data.

$$\phi_{F,x} = \phi_{F,st} \times \frac{F_x}{F_{st}} \times \frac{f_{st}}{f_x} \times \frac{n_x^2}{n_{st}^2} \quad (1)$$

17  
18 st and x represent the standard sample and the test sample, respectively.  $\phi_F$  denotes the  
19 fluorescence quantum yield. F corresponds to the integral area of the fluorescence peak.  $f$  signifies  
20 the absorption factor, and n is the refractive index of the solvent.

1

## 2 **Experimental Procedure for Fluorescence Testing of PTPAS in** 3 **H<sub>2</sub>O/THF Solvent**

4 10 mL solutions with varying ratios of H<sub>2</sub>O/THF were individually prepared, with  
5 ratios of 10:0, 9:1, 8:2, 7:3, 6:4, 5:5, 4:6, 3:7, 2:8, 1:9, and 0:10. Subsequently, 100 μL  
6 of a 2 mM PTPAS solution was sequentially added to each solution. After thorough  
7 shaking and mixing, fluorescence spectra under an excitation wavelength of 365 nm  
8 were tested.

## 9 **Experimental Procedure for the Detection Limit of PTPAS for TNT**

10 A 500 mL solution of PTPAS with a concentration of 0.01 g/L (THF/H<sub>2</sub>O = 1:9)  
11 was prepared. 10 mL were measured and added to corresponding glass bottles.  
12 Subsequently, TNT solutions with concentrations of 1 g/L, including 0, 2.5, 5, 7.5, 10,  
13 17.5, 25, 37.5, 50, 75, and 100 μL, were sequentially added. The fluorescence intensity  
14 of the different solutions was tested under an excitation wavelength of 365 nm, and the  
15 fitting results were analyzed using equations S2 and S3.

$$\frac{I_0}{I} = 1 + K_{SV}[Q]$$

16 (2)

$$C_L = \frac{3S}{K_{SV}}$$

17 (3)

18  $I_0$  and  $I$  represent the initial fluorescence intensity of PTPAS before and after adding TNT,  
19 respectively..  $I$  denotes the fluorescence intensity after complete response to the added TNT.  $[Q]$

1 corresponds to the concentration of TNT in the tested sample.  $K_{sv}$  signifies the Stern-Volmer  
2 constant.  $C_L$  is the detection limit of the sensor.  $S$  represents the 15-fold standard deviation of the  
3 blank sample.

#### 4 **Experimental Procedure for Fluorescence Response Time**

5 10 mL solutions of PTPAS were individually prepared, with the concentrations of  
6 10, 20, 40, 60, 80, and 100  $\mu\text{M}$  ( $\text{H}_2\text{O}/\text{THF}=9:1$ ), and 3.5 mL of each solution was  
7 measured and added to the cuvette. Subsequently, 70  $\mu\text{L}$  of a 2 mM TNT solutions were  
8 also added to the corresponding cuvette. The changes in fluorescence intensity of the  
9 solutions over time were measured under an excitation wavelength of 365 nm.

#### 10 **Experimental Procedure for the Effect of pH on Fluorescence**

##### 11 **Performance**

12 50 mL solutions were prepared with pH values ranging from 1 to 13, using a  $\text{H}_2\text{O}$   
13 and THF ratio of 9:1. Subsequently, 10 mL of each solution was measured and added  
14 to 100  $\mu\text{L}$  of a 2 mM PTPAS THF solution. After thorough mixing by oscillation, the  
15 fluorescence spectra of the solution were measured separately under an excitation  
16 wavelength of 365 nm. Subsequently, 100  $\mu\text{L}$  of a 2 mM TNT solution was added to  
17 the corresponding solutions, thoroughly mixed by oscillation, and the fluorescence  
18 spectra of the solutions at  $\text{pH}=1-13$  were measured under an excitation wavelength of  
19 365 nm.

#### 20 **Experimental Procedure for the Selectivity of PTPAS to TNT**

21 Solutions of metal ion nitrates ( $\text{Ag}^+$ ,  $\text{Al}^{3+}$ ,  $\text{Ca}^{2+}$ ,  $\text{Co}^{3+}$ ,  $\text{Cu}^{2+}$ ,  $\text{Fe}^{2+}$ ,  $\text{Fe}^{3+}$ ,  $\text{Mg}^{2+}$ ,  $\text{Mn}^{2+}$ ,  
22  $\text{Ni}^{2+}$ ,  $\text{Zn}^{2+}$ ) and nitro-based compounds (CNB, NP, DNB, NT, NB, TNT, DNT, HMX,

1 RDX) were prepared in advance at a concentration of 10 mM. A 500 mL solution of  
2 PTPAS with a concentration of 20  $\mu$ M (THF/water = 1:9) was then prepared, and 10  
3 mL of this solution were measured and added to different glass bottles. Subsequently,  
4 20  $\mu$ L of the pre-prepared metal ion and nitro compound solutions were sequentially  
5 added to the corresponding bottles. After equilibration, the fluorescence intensity was  
6 measured under an excitation wavelength of 365 nm.

### 7 **Theoretical Calculation**

8 All theoretical calculations were conducted using the density functional theory  
9 (DFT) within the Gaussian 16 program package. The binding energy between the  
10 polymer and TNT was calculated at the 6-31G(d,p) level of theory using the B3LYP-  
11 GD3(BJ) functional, with the solvent effect of water being considered using the SMD  
12 solvent model. The Natural Transition Orbital (NTO) analysis of the polymer was  
13 performed at the 6-311G(d,p) level of theory using the B3LYP-GD3(BJ) functional,  
14 with the solvent effect of tetrahydrofuran being considered using the SMD solvent  
15 model.

### 16 **Lippert-Mataga equation**

$$\Delta f = \frac{\varepsilon - 1}{2\varepsilon + 1} - \frac{n^2 - 1}{2n^2 + 1} \quad (4)$$

17  
18  $\Delta f$  represents the orientational polarizability of the solvent.  $n$  is the refractive index  
19 of the solvent.  $\varepsilon$  denotes the dielectric constant of the solvent.
