**Table S1.** List of DNA sequences used in the study.

Name	Sequences (5'→3')
polyT-linker	5'-TTTTTTTTTTTTTTTTTTTTTTTTTTGGTTTTTTTTTTTTTTTTTTTTTTT-3'
Cu <sup>2+</sup> -DNAzyme	5'-GGTTCCTCAGCATCTCTTTCTAATACGACTCAGAATGAGTCTGGGCCTCT TTCTTTTAGAAAGAAC-3'
Product 1 (P <sub>1</sub> )	5'-ACTCAGAATGAGTCTGGGCCTCTTTCTTTTAGAAAGAAC-3'
Product 2 (P <sub>2</sub> )	5'-GGTTCCTCAGCATCTCTTTCTAATACG-3'
SH-Cu <sup>2+</sup> -DNAzyme	5'-/5ThioMC6-D/ GGTTCCTCAGCATCTCTTTCTAATACGACTCAGAATGAG TCTGGGCCTCTTTCTTTTAGAAAGAAC-3'
Cu <sup>2+</sup> -polyA-capture DNA	5'-AAAAAAAAAAAAAAAAAAACGTATTAGAAAGAGA-3'
SH-VEGF aptamer (Aptamer1)	5'-/5ThioMC6-D/ATGACTAGGTGGGGGTGGACGGGCCGGGTAGA-3'
VEGF aptamer (Aptamer2)	5'-AAAAAAAAAAAAAAAAAAACAATTGGGCCCGTCCGTATGGTGGGT-3'

The sequences labeled in blue represent copper ion-dependent DNAzymes, and the triangles indicate the cut sites.

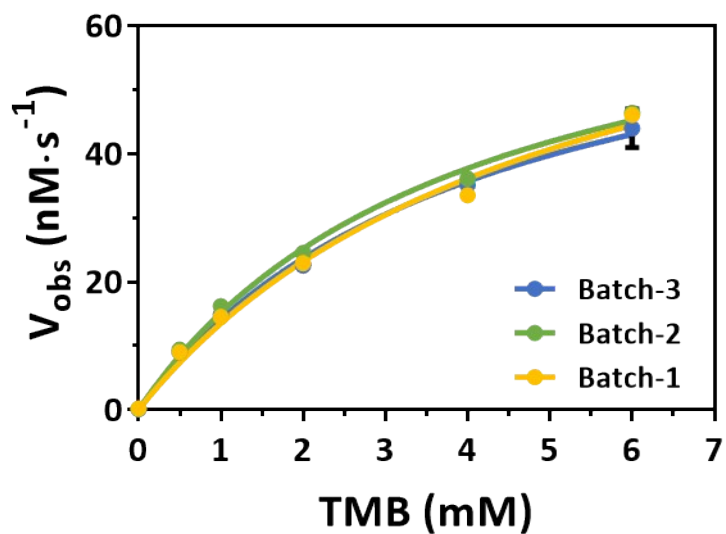

The sequences marked with an underline are complementary.

The sequences labeled in red are crucial for VEGF recognition.

**Figure S1. SEM images of DNA-PBNPs synthesized with varying ratios of PBNPs to polyT-DNA.**

(A) Scheme of DNA-modified PBNPs by DNA adsorption on the porous surface of PBNPs. (B) Table of three concentration ratios of PBNPs to polyT-DNA used in DNA-PBNP synthesis. (C) SEM images of DNA-PBNPs synthesized at different PBNP to polyT-DNA ratios: (a, c) Condition I: 0.1 mg/mL PBNPs and 10  $\mu\text{M}$  polyT-DNA; (b, e) Condition II: 0.05 mg/mL PBNPs and 10  $\mu\text{M}$  polyT-DNA; (c, f) Condition III: 0.03 mg/mL PBNPs and 10  $\mu\text{M}$  polyT-DNA. Scale bar: (a-c) 2  $\mu\text{m}$  and (d-f) 100 nm.

**Figure S2. Catalytic activity of the DNA-PBNPs with different synthesized batches.**

(A) Rates of oxidation of different concentrations of TMB<sub>red</sub> to TMB<sub>ox</sub> by different batch of DNA-PBNPs in the presence of H<sub>2</sub>O<sub>2</sub>. In all experiments, [H<sub>2</sub>O<sub>2</sub>] = 2 mM, [PBNP] or [DNA-PBNPs] = 10 μg mL<sup>-1</sup>.

**Figure S3. Comparative analysis of catalytic activity between PBNPs and horseradish peroxidase (HRP) at various temperatures.** After PBNPs and HRP were maintained for 15 minutes at different temperatures, their catalytic activity was tested using K-Blue reagent as the substrate. [PBNP] and [HRP] = 10  $\mu\text{g mL}^{-1}$ .

We examined the impact of glutathione (GSH) on the self-cleavage process of  $\text{Cu}^{2+}$ -DNAzyme using DNA electrophoresis (Figure S3). Gel electrophoresis of the self-cleavage assay showed that the DNA enzyme remained intact in the presence of only GSH or only  $\text{Cu}^{2+}$ . In contrast, when GSH and  $\text{Cu}^{2+}$  coexist, the gel displays cleavage products (P1 and P2). These results revealed that both copper ions and glutathione (GSH) are indispensable for activating the catalytic capability of DNAzyme.

**Figure S4. Influence of glutathione on the self-cleavage reaction of  $\text{Cu}^{2+}$ -DNAzyme.**

M is the DNA ladder; P<sub>1</sub> and P<sub>2</sub> are the product of the self-cleavage reaction of  $\text{Cu}^{2+}$ -DNAzyme. The catalytic assay of  $\text{Cu}^{2+}$ -DNAzyme was performed in a 20  $\mu\text{L}$  reaction mixture containing 0.5  $\mu\text{M}$   $\text{Cu}^{2+}$ -DNAzyme, 50  $\mu\text{M}$   $\text{Cu}^{2+}$ , 50  $\mu\text{M}$  GSH, 0.3 M NaCl, and 50 mM Tris-HCl (pH 7.0). The reaction mixture incubated at room temperature for 1 hour. The experiment was conducted on 12% acrylamide (19:1) denature gel with 1 $\times$  TBE running buffer under 120 V, 50 minutes.

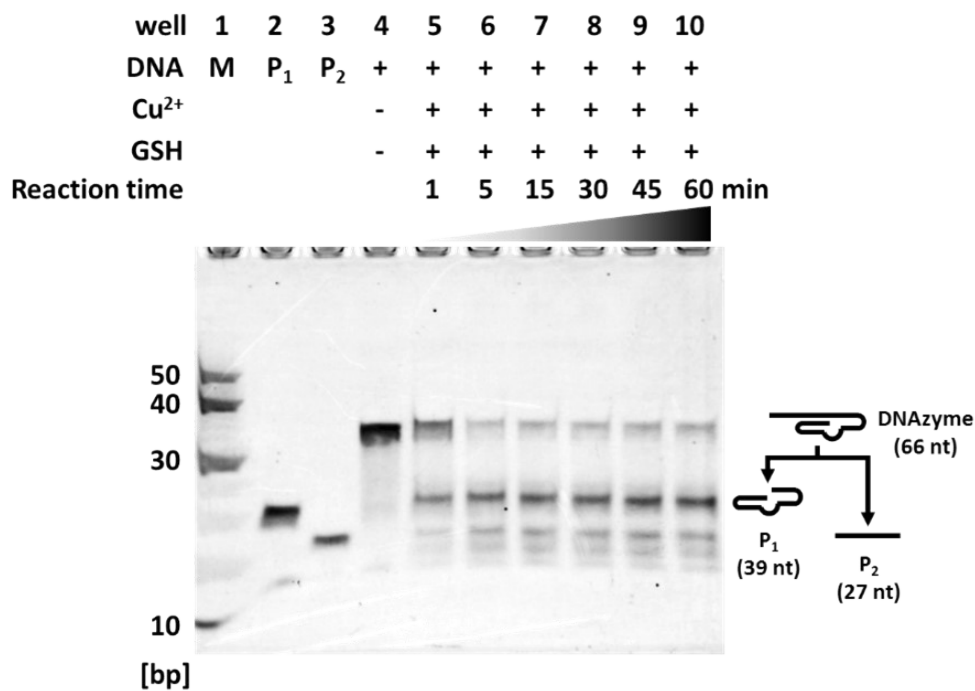

The metal ion selectivity of Cu<sup>2+</sup>-DNAzyme was investigated by different metal ions (Cu<sup>2+</sup>, Mg<sup>2+</sup>, K<sup>+</sup>, Ca<sup>2+</sup>, Fe<sup>3+</sup>, Ni<sup>2+</sup>, and Zn<sup>2+</sup>) in the presence of GSH. Only Cu<sup>2+</sup> efficiently triggered self-cleavage of DNAzyme, resulting the production of cleavage products (P<sub>1</sub> and P<sub>2</sub>). According to the result, this self-cleavage reaction of the Cu<sup>2+</sup>-DNAzyme is specific for Cu<sup>2+</sup>.

**Figure S5. Influence of metal ions on the self-cleavage reaction of Cu<sup>2+</sup>-DNAzyme.**

M is the DNA ladder; P<sub>1</sub> and P<sub>2</sub> are the product of the self-cleavage reaction of Cu<sup>2+</sup>-DNAzyme. The catalytic assay of Cu<sup>2+</sup>-DNAzyme was performed in a 20 μL reaction mixture containing 0.5 μM Cu<sup>2+</sup>-DNAzyme, 50 μM different metal ions (Mg<sup>2+</sup>, K<sup>+</sup>, Ca<sup>2+</sup>, Fe<sup>3+</sup>, Ni<sup>2+</sup>, Zn<sup>2+</sup>, and Cu<sup>2+</sup>, respectively), 50 μM GSH, 0.3 M NaCl, and 50 mM Tris-HCl (pH 7.0). The reaction mixture was incubated at room temperature for 1 hour. The experiment was conducted on 12% acrylamide (19:1) denature gel with 1× TBE running buffer under 120 V, 55 minutes.

**Figure S6. Influence of reaction time on self-cleavage the reaction of Cu<sup>2+</sup>-DNAzyme.**

M is the DNA ladder; P<sub>1</sub> and P<sub>2</sub> are the product of the self-cleavage reaction of Cu<sup>2+</sup>-DNAzyme. The catalytic assay of Cu<sup>2+</sup>-DNAzyme was performed in a 20 μL reaction mixture containing 0.5 μM Cu<sup>2+</sup>-DNAzyme, 50 μM Cu<sup>2+</sup>, 50 μM GSH, 0.3 M NaCl, and 50 mM Tris-HCl (pH 7.0). The reaction mixture was incubated at room temperature for 1, 5, 15, 30, 45, and 60 minutes, respectively. The reaction mixture was incubated at room temperature for 1 hour. The experiment was conducted on 12% acrylamide (19:1) denature gel with 1× TBE running buffer under 120 V, 55 minutes

**Figure S7. Optimization of DNA-PBNPs-based biosensor for VEGF detection.**

The effect on the output signal due to varying factors is as follows: (A) the duration of VEGF incubation (ranging from 0 to 60 minutes), (B) the concentrations of Aptamer 2 (ranging from 0.01 to 2 µM), and (C) the concentrations of DNA-PBNPs (ranging from 0 to 0.4 mg/mL). N=3, mean ± SD.

**Figure S8. Matrix effect of DNA-PBNPs-based biosensor for VEGF detection.**

The output signals of the biosensor under various percentages of fetal bovine serum (FBS) in the absence and presence of VEGF (10 ng/mL). (\*:  $P \leq 0.05$ , \*\*:  $P \leq 0.01$ , \*\*\*:  $P \leq 0.001$ )
